

# Forecasting and Modeling Storm Surge

Jamie Rhome  
National Hurricane Center  
Storm Surge Unit

# Interpreting Surge Forecasts

- What does 20 feet of storm surge mean?
  - 20 feet of storm surge above ground?
  - 20 feet of storm surge above mean sea level?
  - What is mean sea level?
- All water level observations and models referenced as height above a vertical datum
- A **vertical datum** is simply a **reference level**, a zero surface to which storm surge heights are referred

# Illustration of Vertical Datums

# Vertical Datums

- **Tidal datums** reference water levels defined by a phase of the tide
  - Mean Sea Level (MSL)
  - Mean Lower Low Water (MLLW)
- **Geodetic datums** based on a simplified surface that represents the Earth's shape and size
  - National Geodetic Vertical Datum of 1929 (**NGVD 29**)
  - North American Vertical Datum of 1988 (**NAVD 88**)
- **SLOSH** references **NAVD 88** and **NGVD 29**
- **NAVD 88** is a newer, more accurate geodetic datum than **NGVD 29**

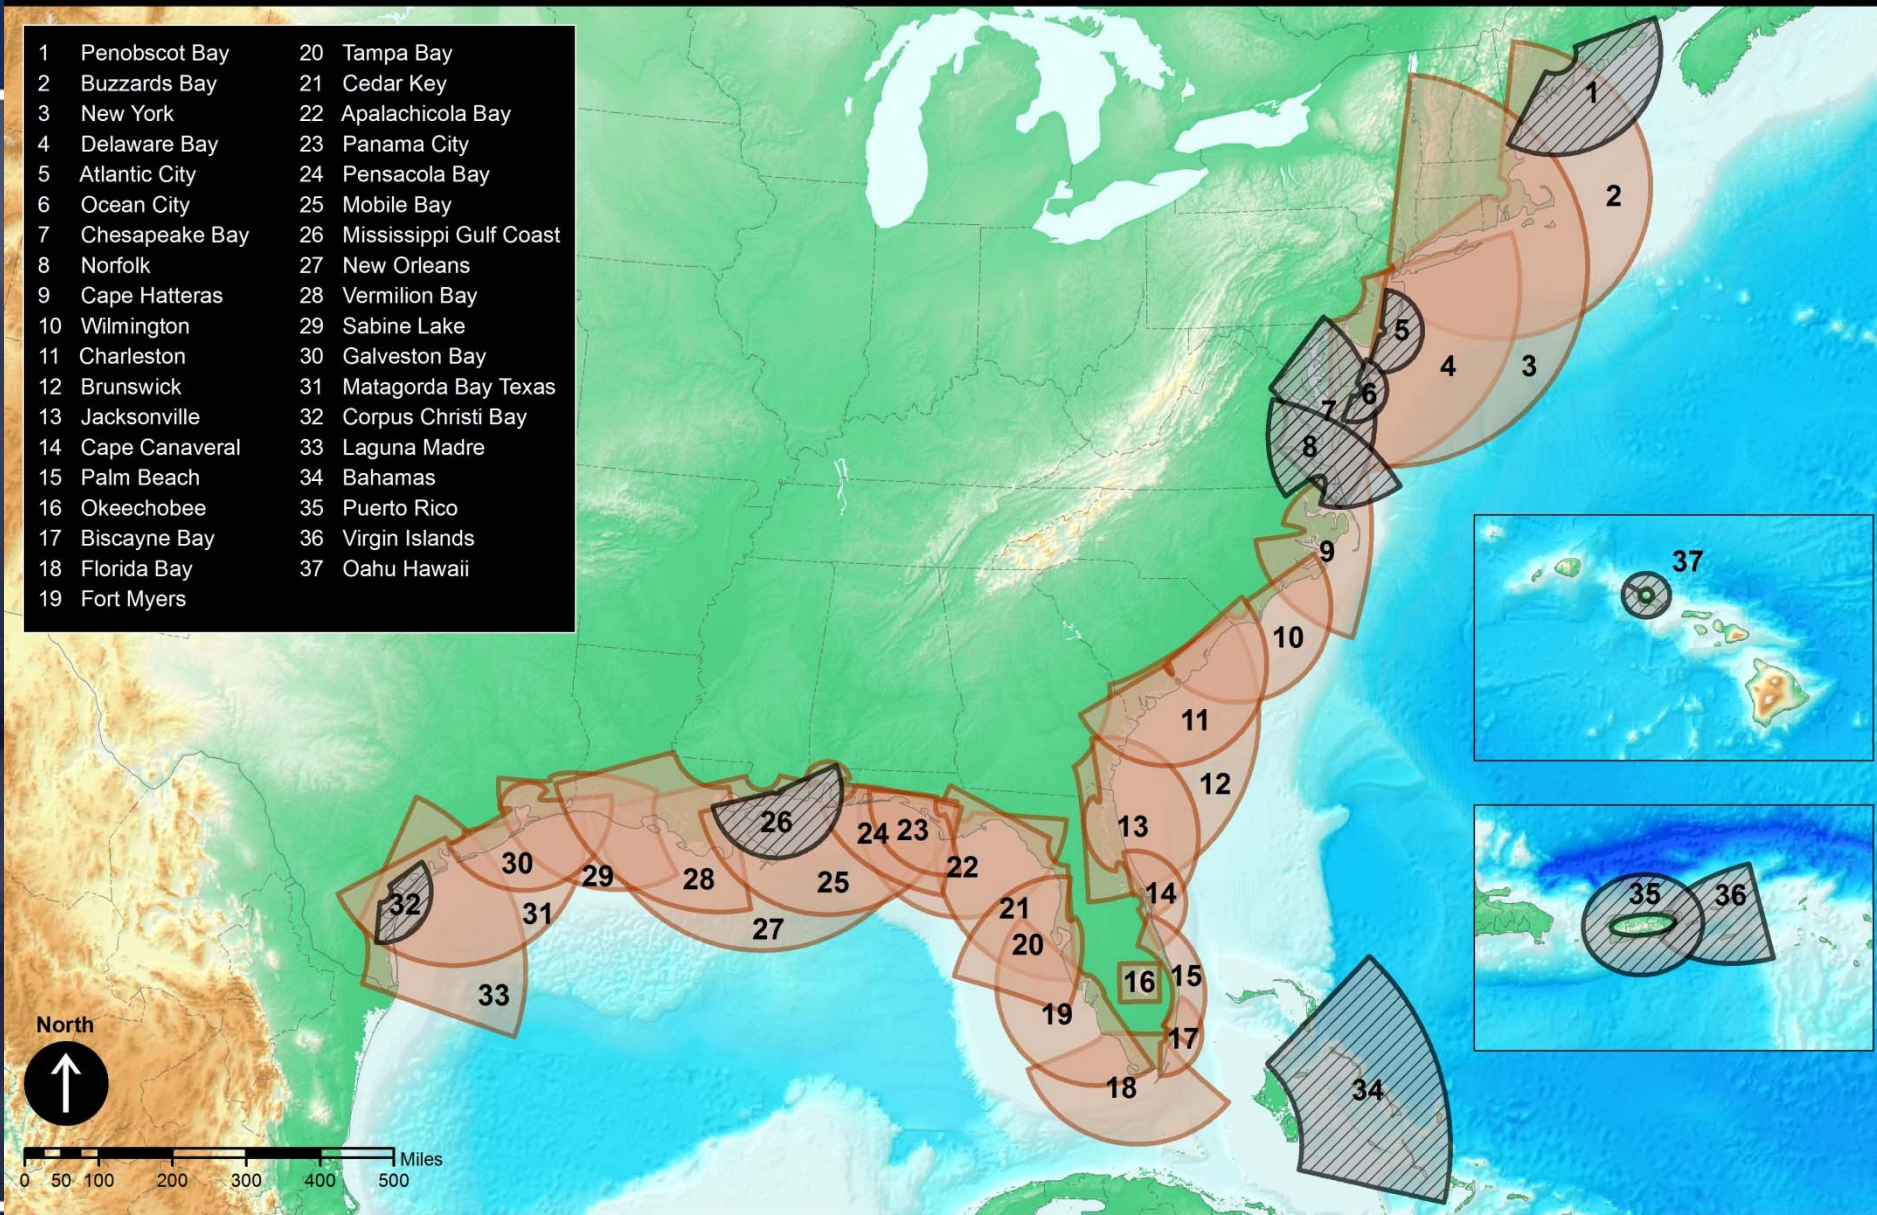

# Operational SLOSH Basins by Vertical Datum

Updated February 2012

- |                   |                           |
|-------------------|---------------------------|
| 1 Penobscot Bay   | 20 Tampa Bay              |

National Hurricane Center  
Storm Surge Unit

NAVD88 SLOSH Basin

NGVD29 SLOSH Basin

# Vertical Datums

- What is the relationship between NAVD88, NGVD29 and MLLW?
  - Complex
  - Conversion tools exist but must be used carefully
  - Cannot extrapolate between locations
  - Real-time tide data available online in MLLW and NAVD88 ([tidesandcurrents.noaa.gov](https://tidesandcurrents.noaa.gov))

# Vertical Datums Bottom Line

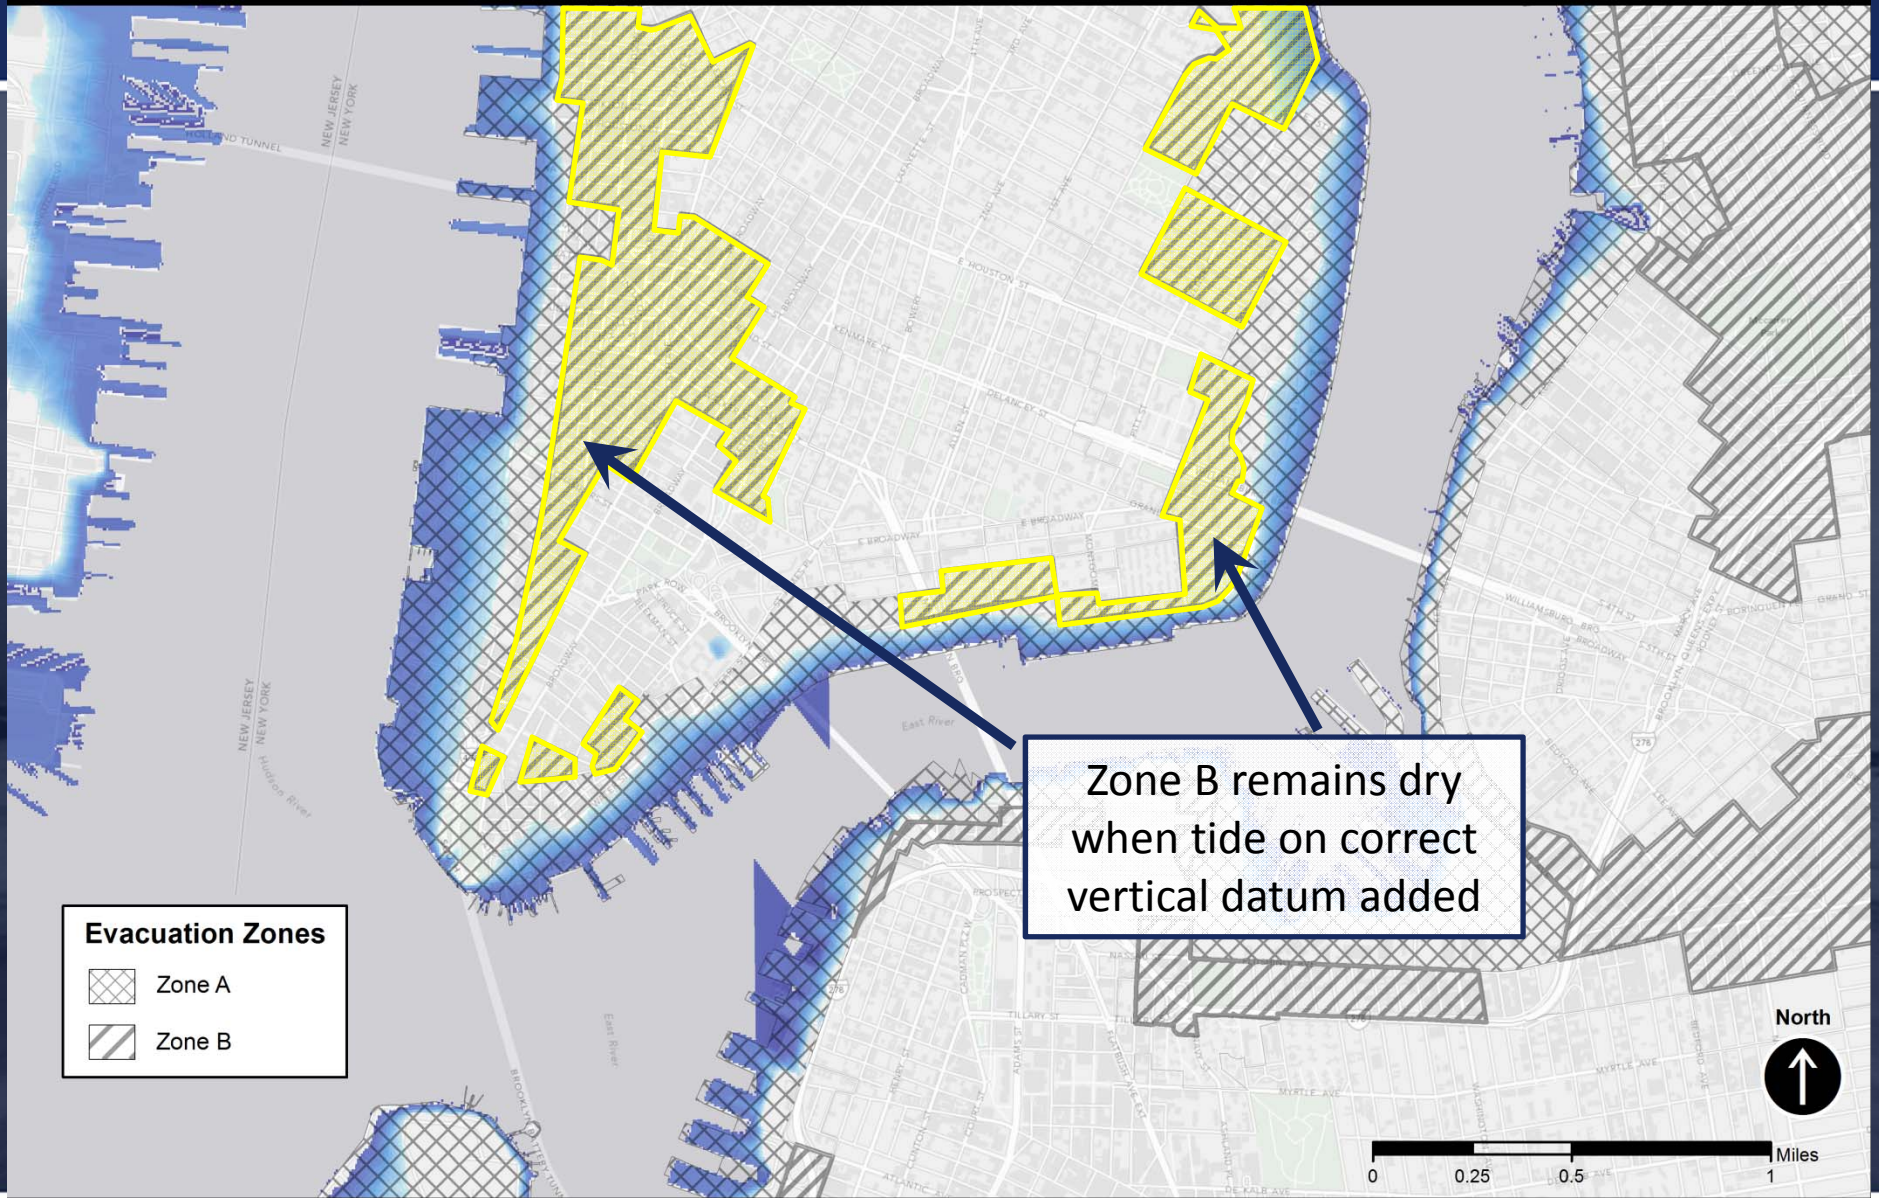

- Know your vertical datum (20 feet of surge above...)
- NEVER attempt to add tide to a storm surge forecast
- ALWAYS use consistent vertical datums when comparing water levels
- One cannot use a given conversion factor for datums conversion
- Datums conversion tools do exist but they are complicated
- When in doubt, don't go it alone. Rely on your local NWS office for assistance!

# Modeling Surge

- Statistical
  - Utilize historical data to develop statistical relationships
  - Necessary data is non-existent

# Modeling Surge

## Statistical

Utilize historical data to develop statistical relationships  
Necessary data is non-existent

- Deterministic Numerical Models
  - Forecast surge based on solving physical equations
  - Strongly dependent on accurate meteorological input
  - Current uncertainty in tropical cyclone forecasts render such methods inaccurate

# Modeling Surge

## Statistical

Utilize historical data to develop statistical relationships  
Necessary data is non-existent

## Deterministic Numerical Models

Forecast surge based on solving physical equations  
Strongly dependent on accurate meteorological input  
Current uncertainty in tropical cyclone forecasts render such methods inaccurate

### o Numerical Model Ensemble

- Many different runs of the same model but with different conditions (family of storms)
- **Best approach for determining storm surge vulnerability** for an area since it takes into account forecast uncertainty

# SLOSH

- Sea, Lake, and Overland Surges from Hurricanes
- A computerized numerical model developed by the National Weather Service (NWS) to estimate storm surge heights (and winds) resulting from historical, hypothetical, or predicted hurricanes

# SLOSH

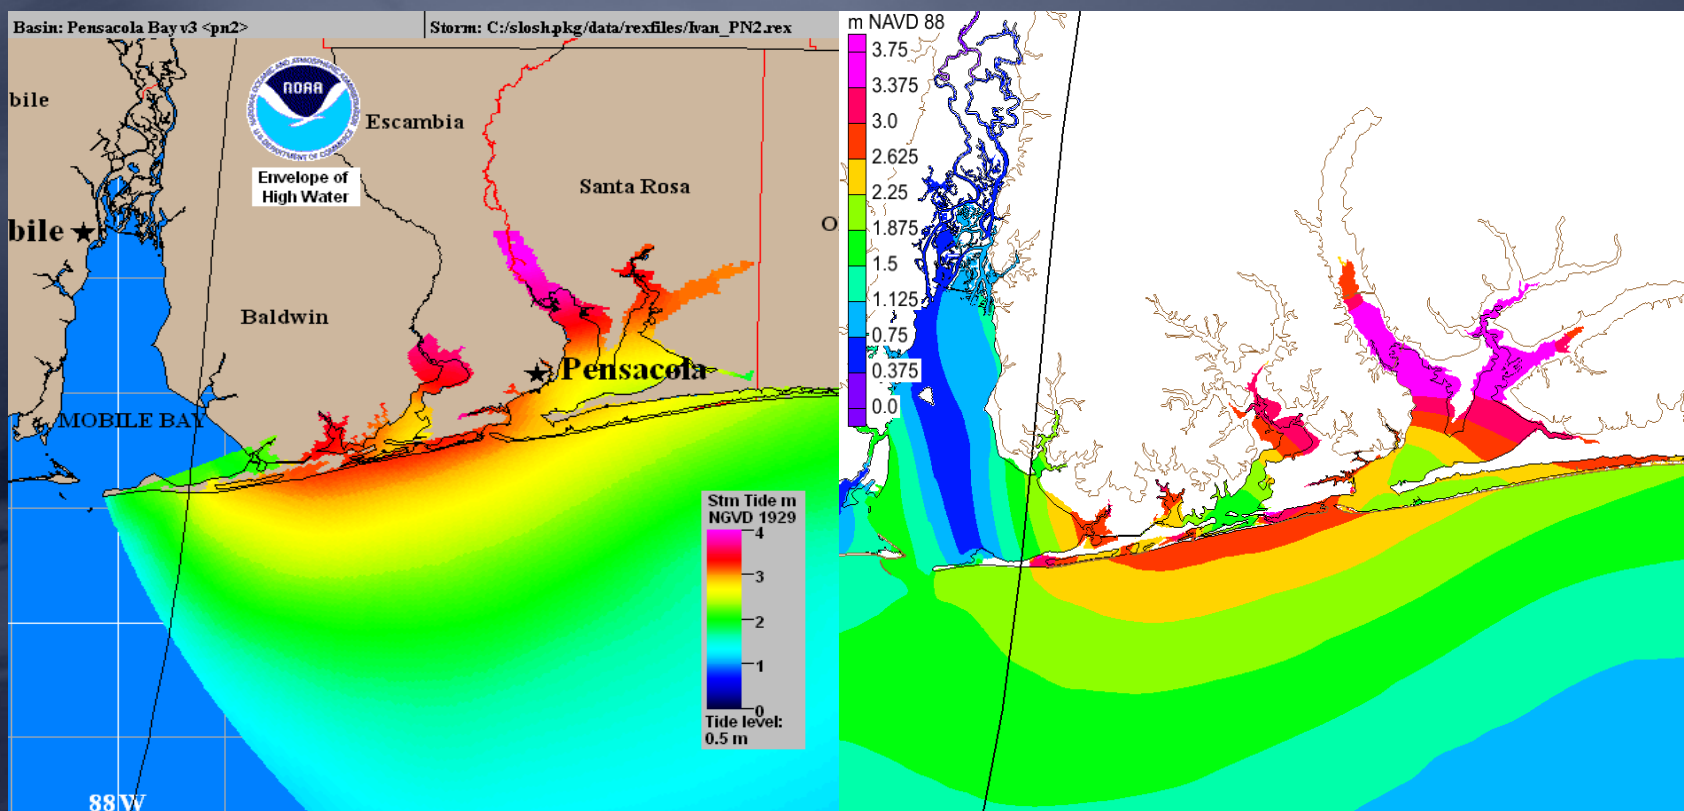

## Strengths and Limitations

- SLOSH **does include**:
  - Flow through barriers/gaps/passages
  - Deep passes between bodies of water
  - Inland inundation (wet/dry cell)
  - Overtopping of **barrier systems, levees**, and roads
  - Coastal reflection (coastally trapped Kelvin waves)
- SLOSH **does not include**:
  - Breaking **waves**/wave run-up
  - Astronomical tide
  - Operational runs can be run at different tide levels via an initial water level (anomaly)
  - Normal **river flow and rain**

# SLOSH and ADCIRC

Overall flooding pattern very similar

SLOSH run, Hurricane Ivan

ADCIRC run, Hurricane Ivan

# Forecasting Storm Surge

- All storm surge models are **STRONGLY** dependent on the accuracy of the **meteorological input**
- Meteorological uncertainty will dominate over storm surge model specifications (physics, resolution, etc)
- Different vertical datums/reference levels
- Storm surge is only one component in the real water level rise

**Total water rise = surge + tides + waves + freshwater flow**

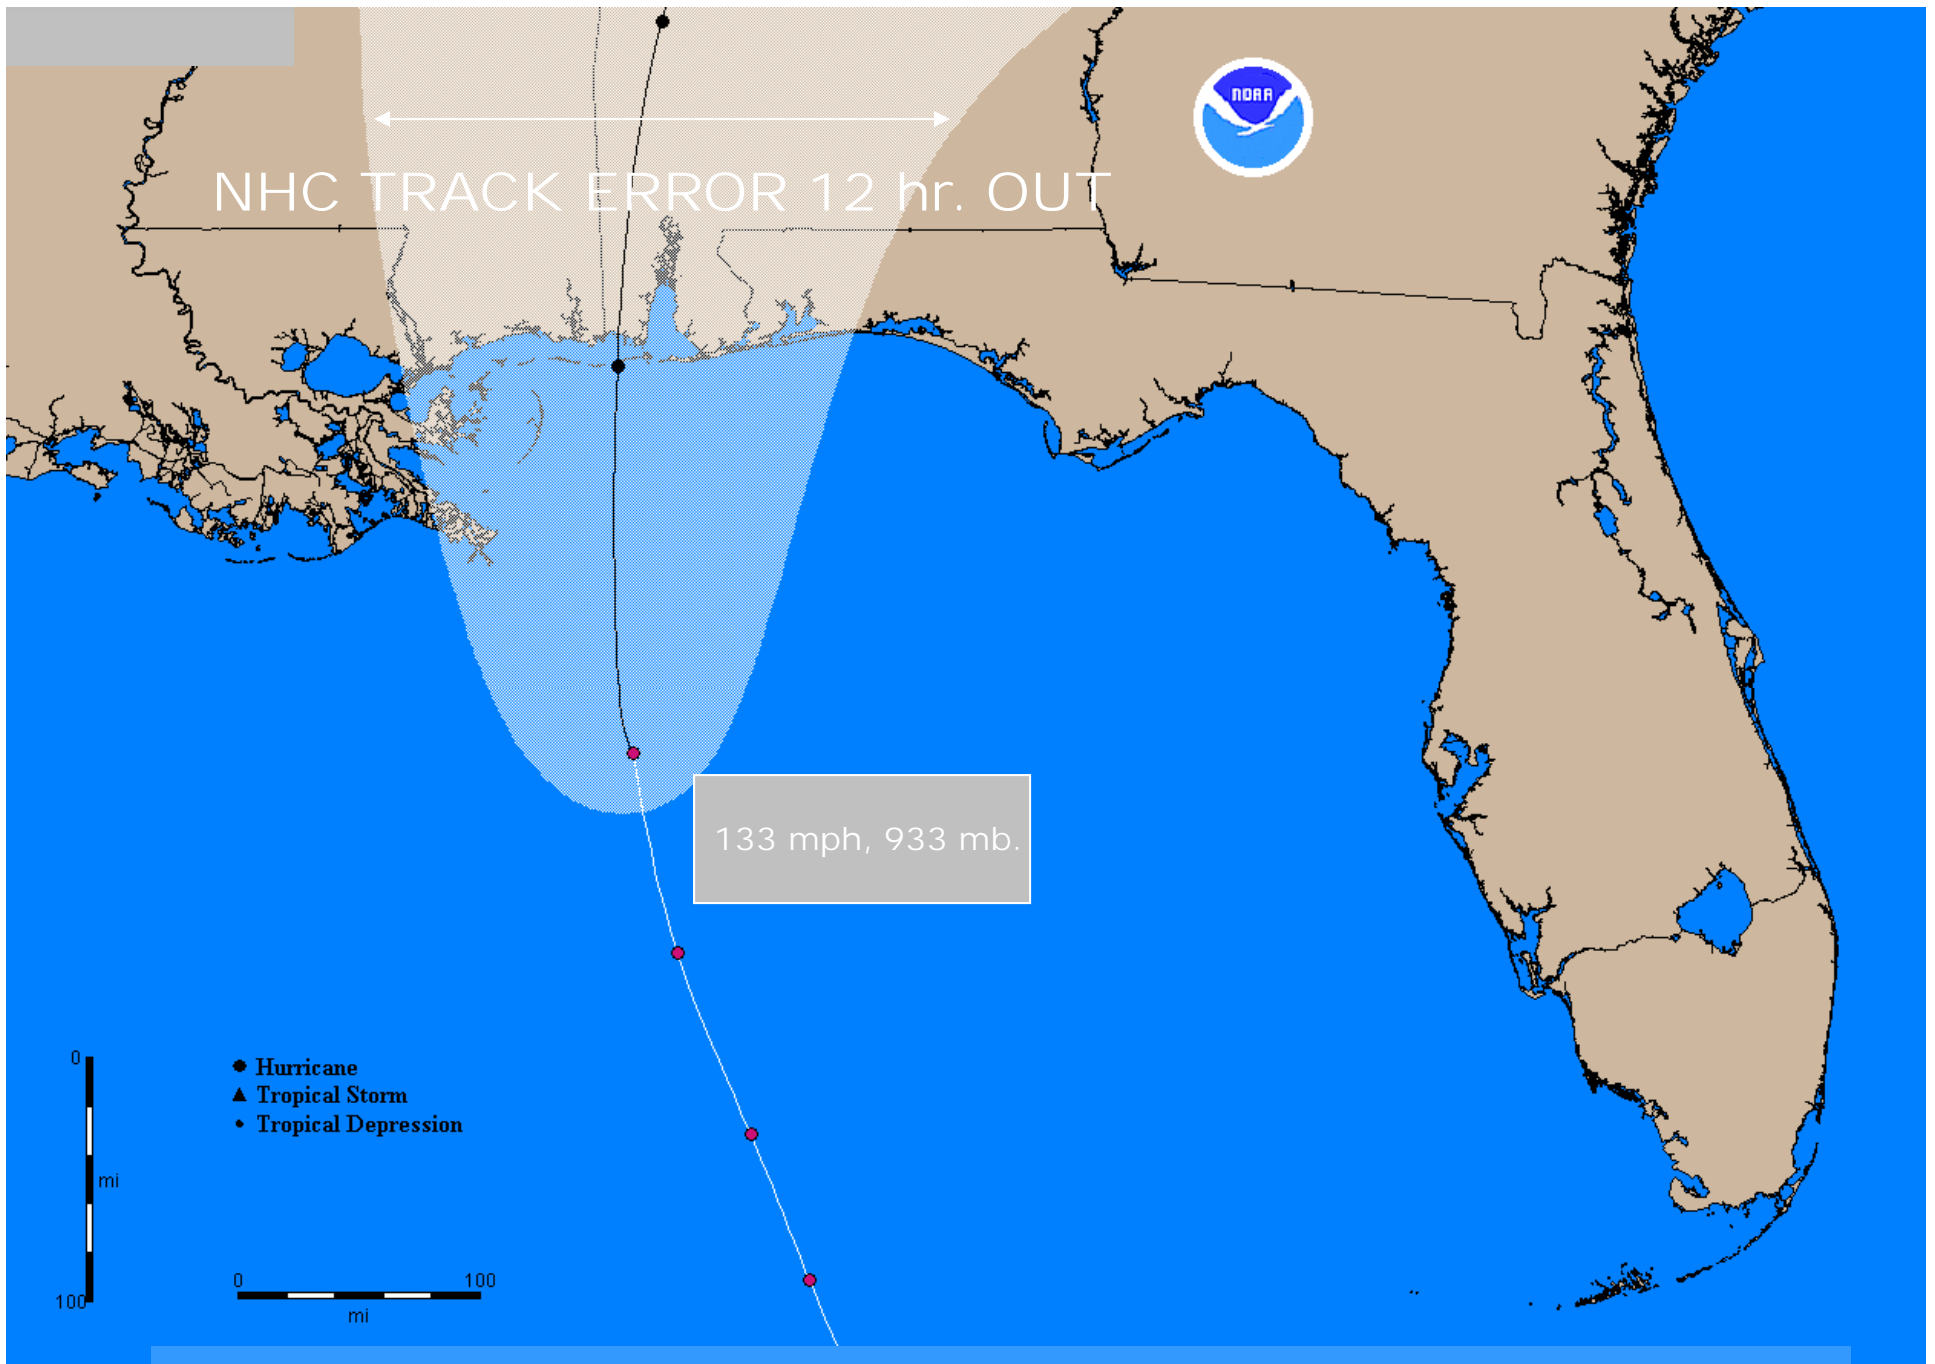

# Track Forecast Uncertainty

## NHC Official Annual Average Track Errors Atlantic Basin Tropical Storms and Hurricanes

Hurricane Advisory - Approximately 12 hr. before landfall

Basin: Elliptical Mobile Bay <mob>

Storm: c:/slosh/pkg/data/rexfiles/i54\_mob\_rex

Envelope of High Water

# Alternative to Single Runs

Atlas of pre-computed surge maps based on

- Different directions of motion
- Different landfall locations
- Different intensities
- Different storm sizes
- Different forward speeds

# Ensemble Guidance

MEOWs

Maximum Envelopes Of Water

MOMs

Maximum Of the MEOWs

P-surge

Probabilistic Storm Surge

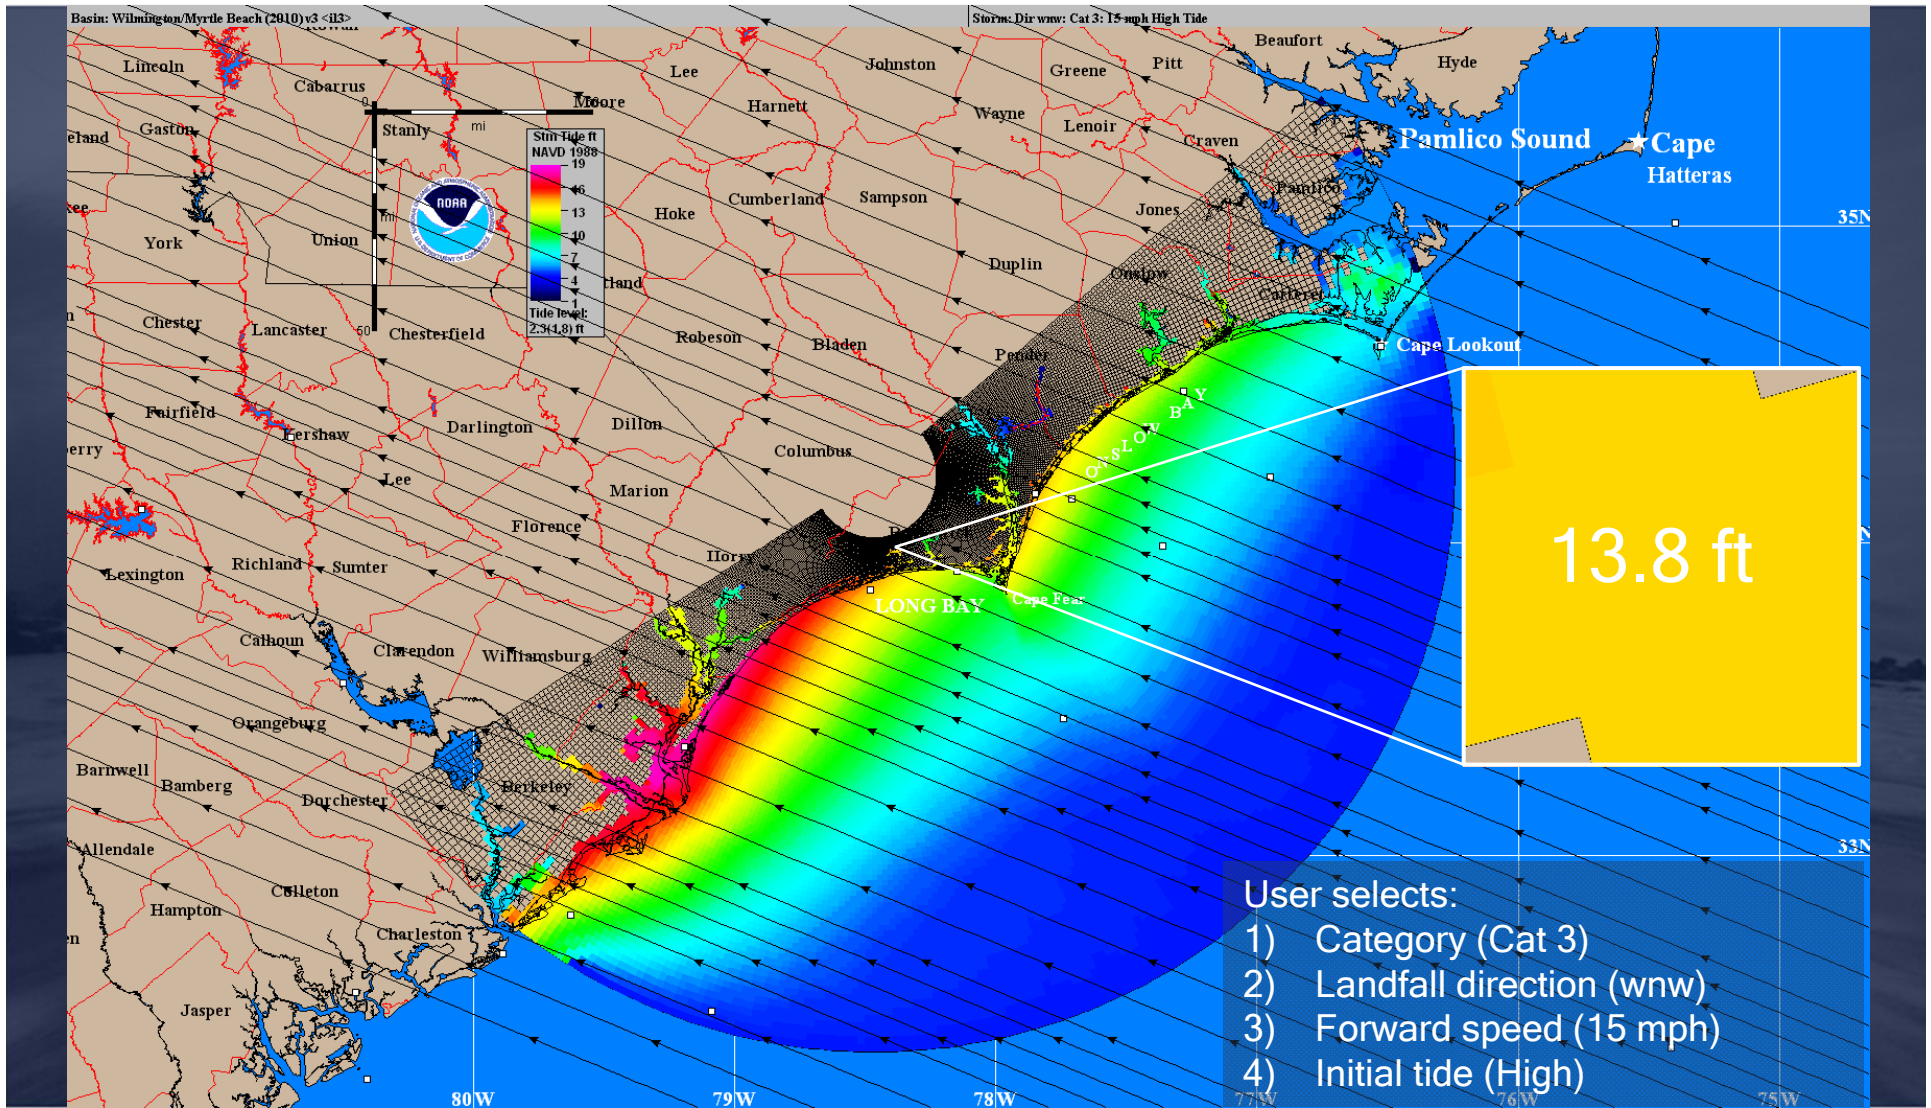

# MEOW Maximum Envelope Of Water

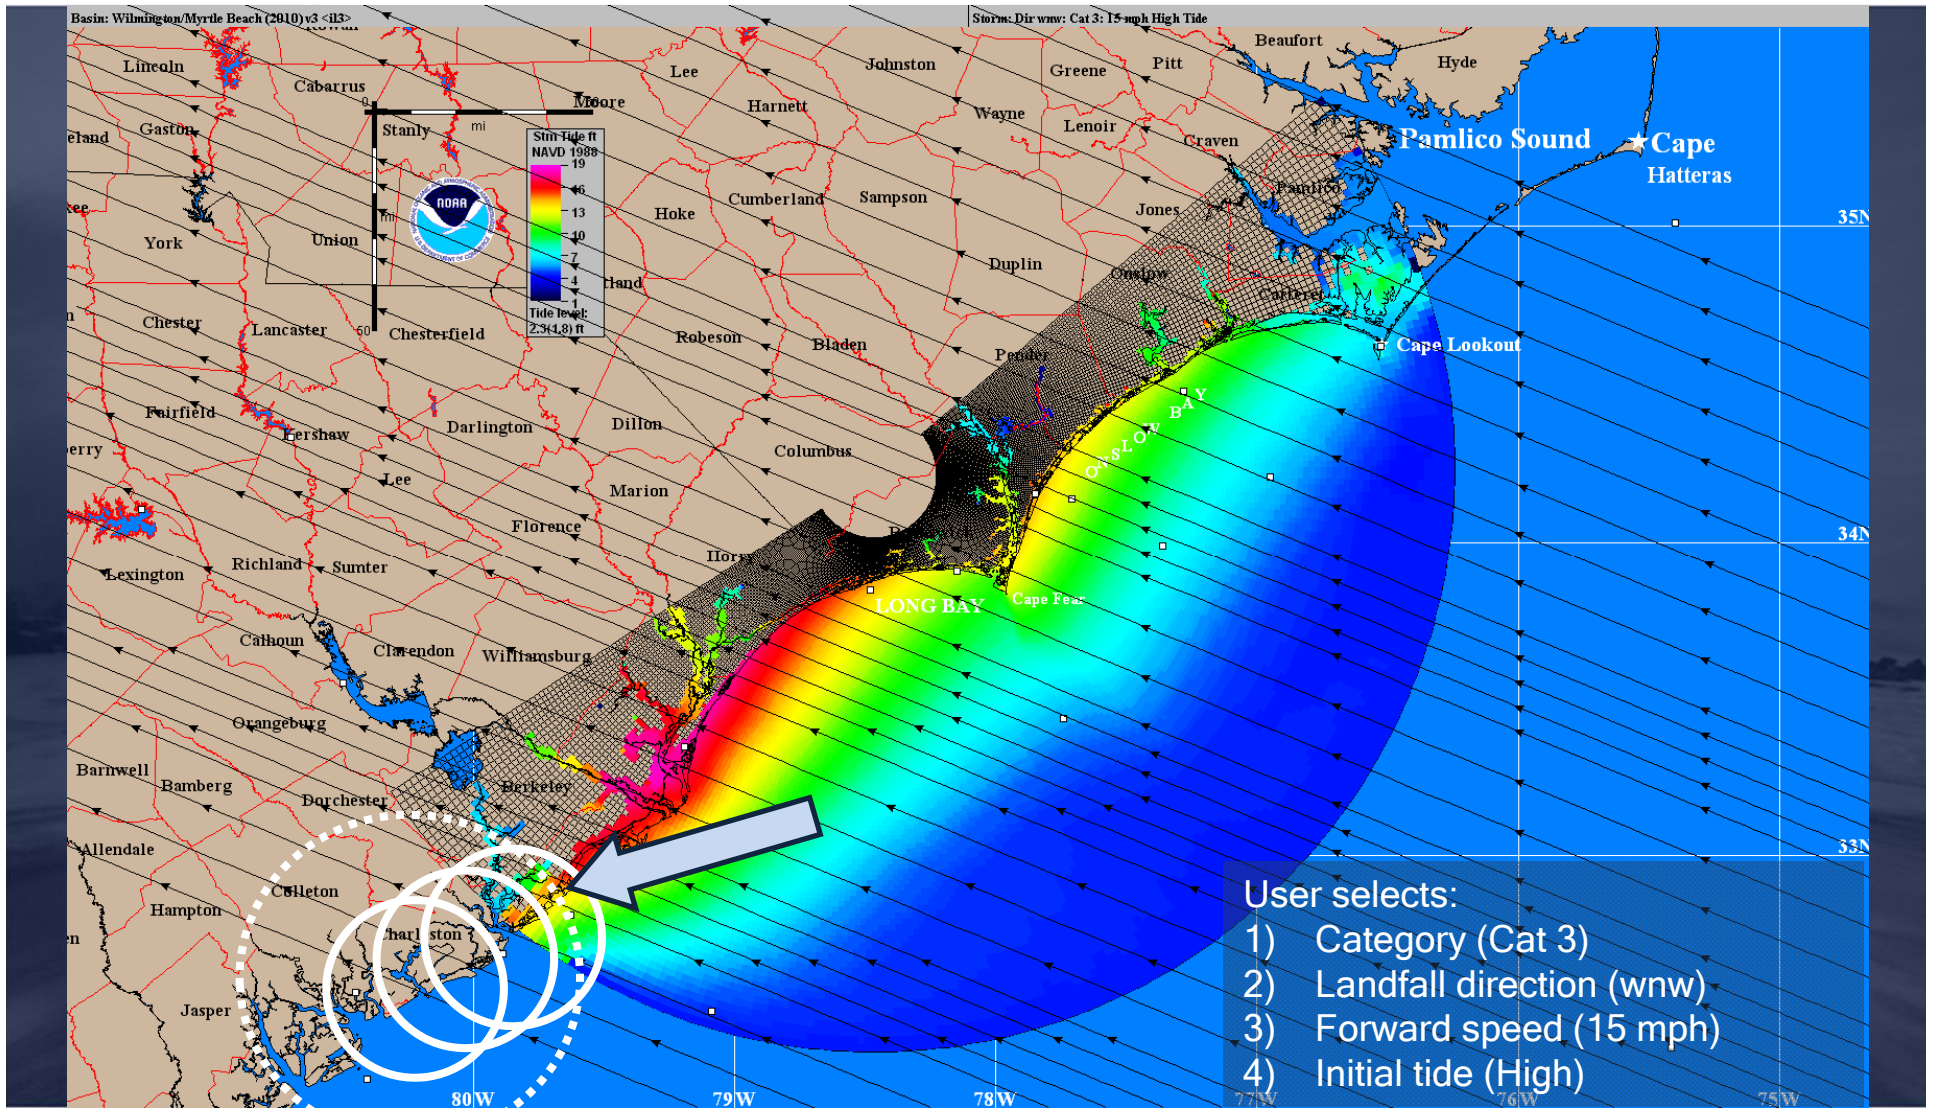

# Maximum Envelope of Water (MEOW)

User selects:

- 1) Category (Cat 3)
- 2) Landfall direction (wnw)
- 3) Forward speed (15 mph)
- 4) Initial tide (High)

# Ensemble Guidance

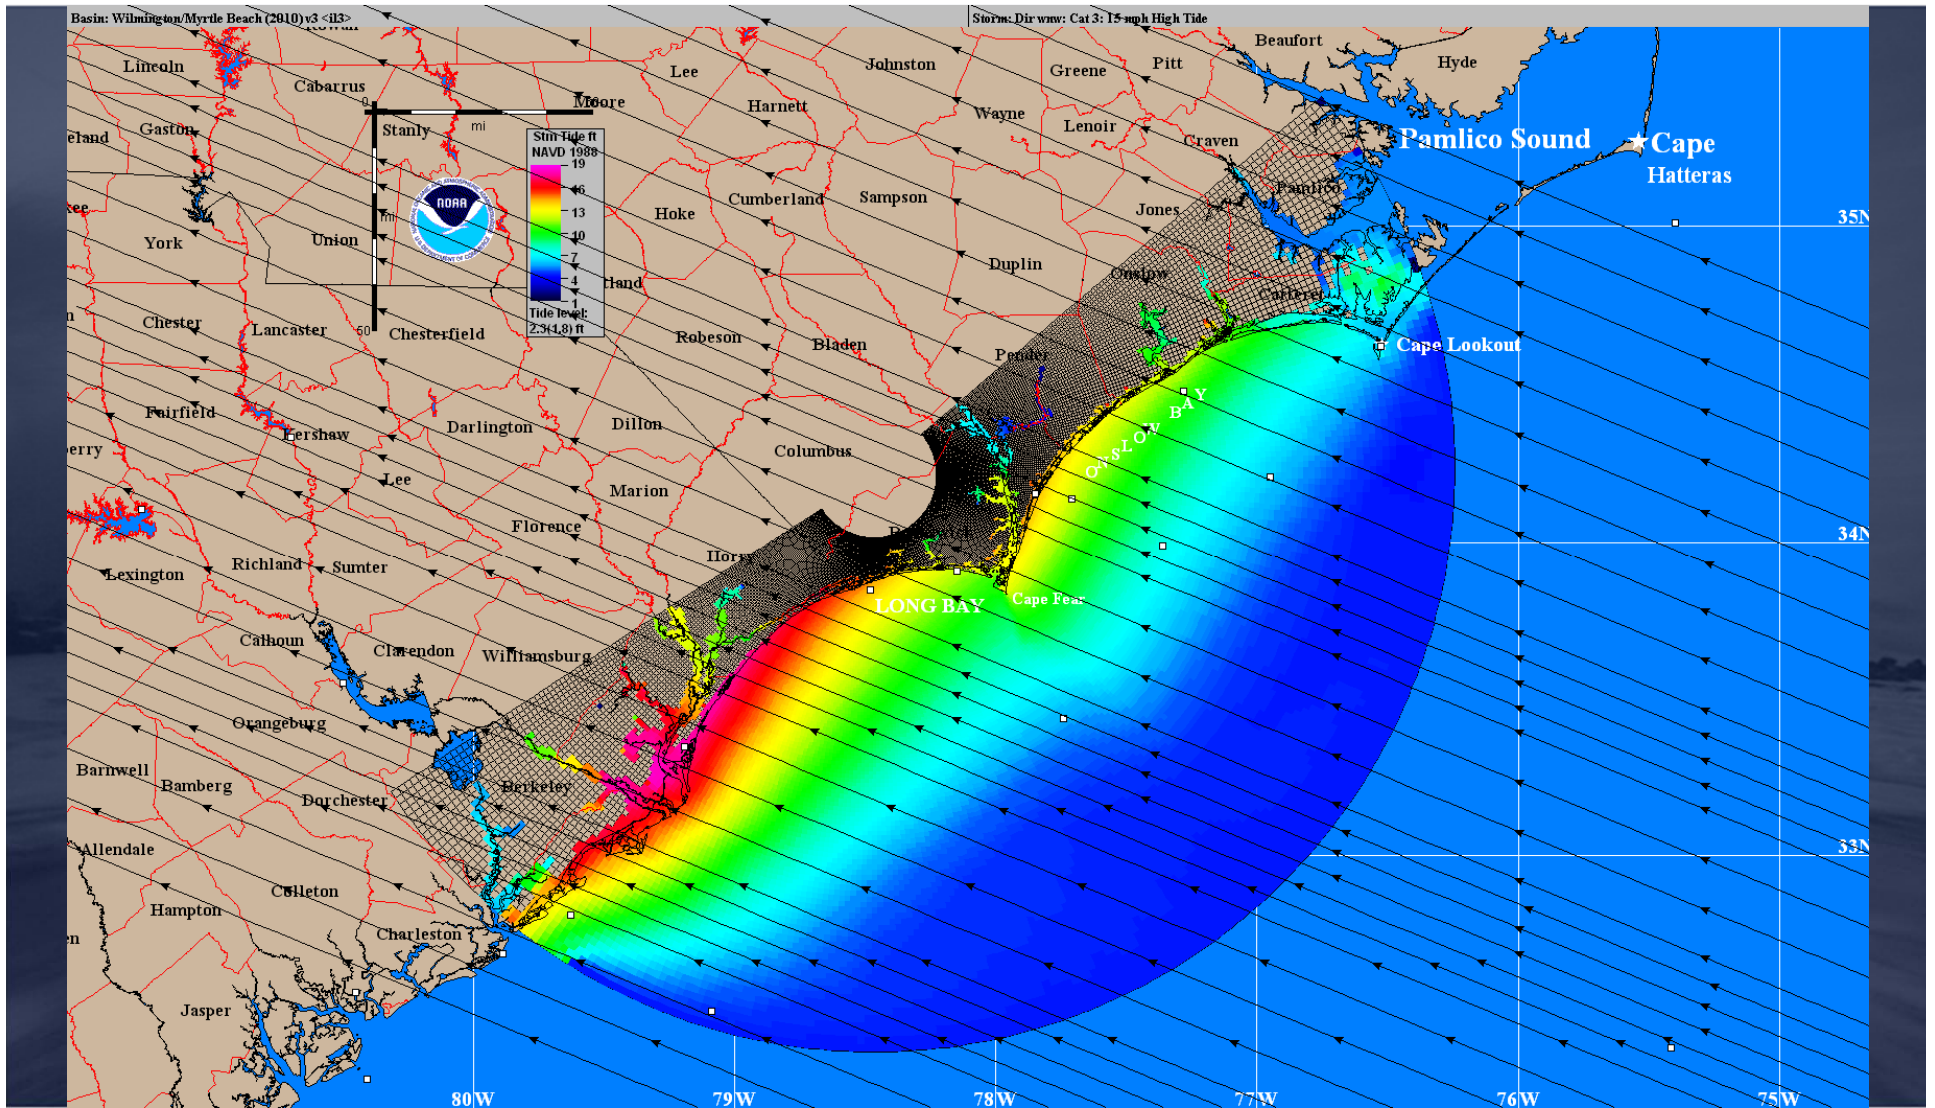

User selects:

- 1) Category (Cat 3)
- 2) Landfall direction (wnw)
- 3) Forward speed (15 mph)
- 4) Initial tide (High)

# Ensemble Guidance

# MOM

- Maximum of MEOWs
- Composite of the maximum storm surge height for all hurricanes of a given category
- Disregards forward speed, landfall direction, landfall location, etc.
- Only 1 MOM per storm category

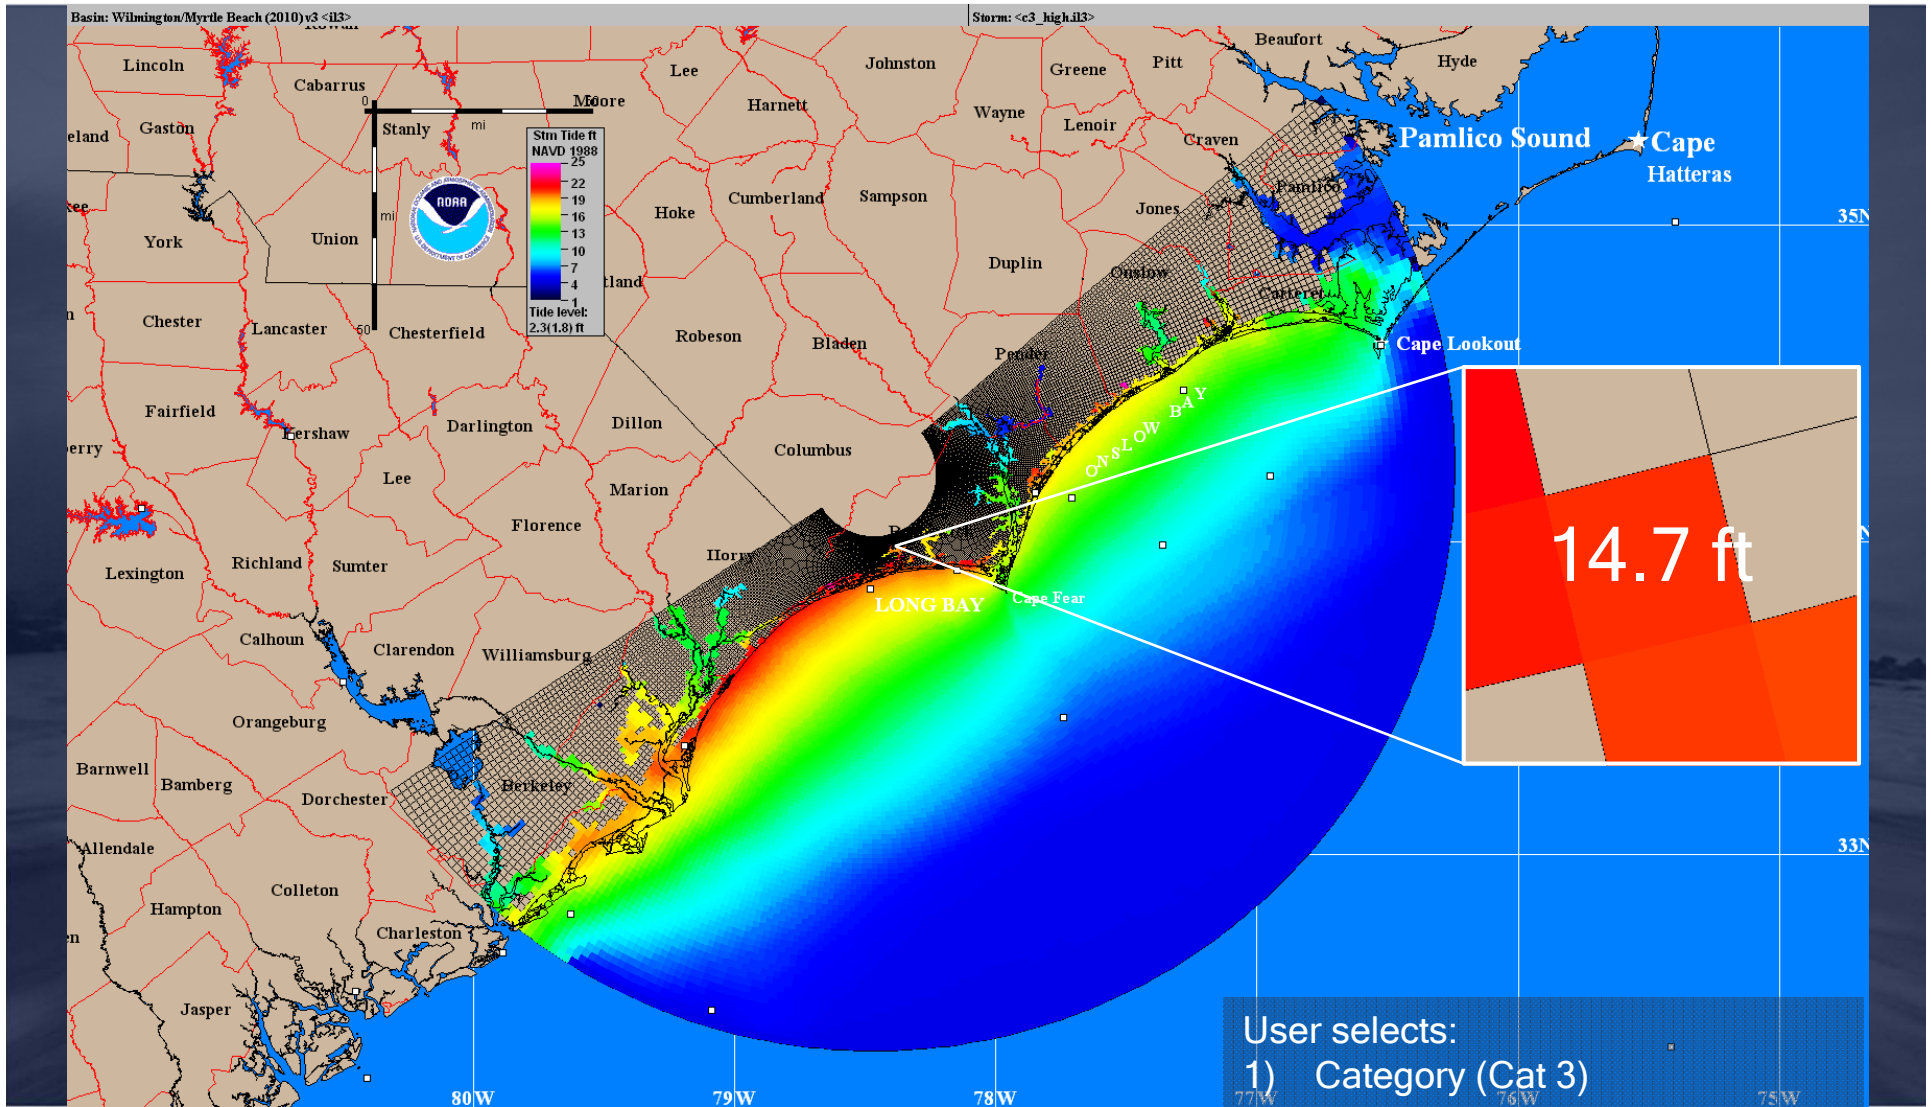

MOM  
Maximum Of the MEOWs

# Maximum of the MEOWs (MOMs)

# P-surge Probabilistic Storm Surge

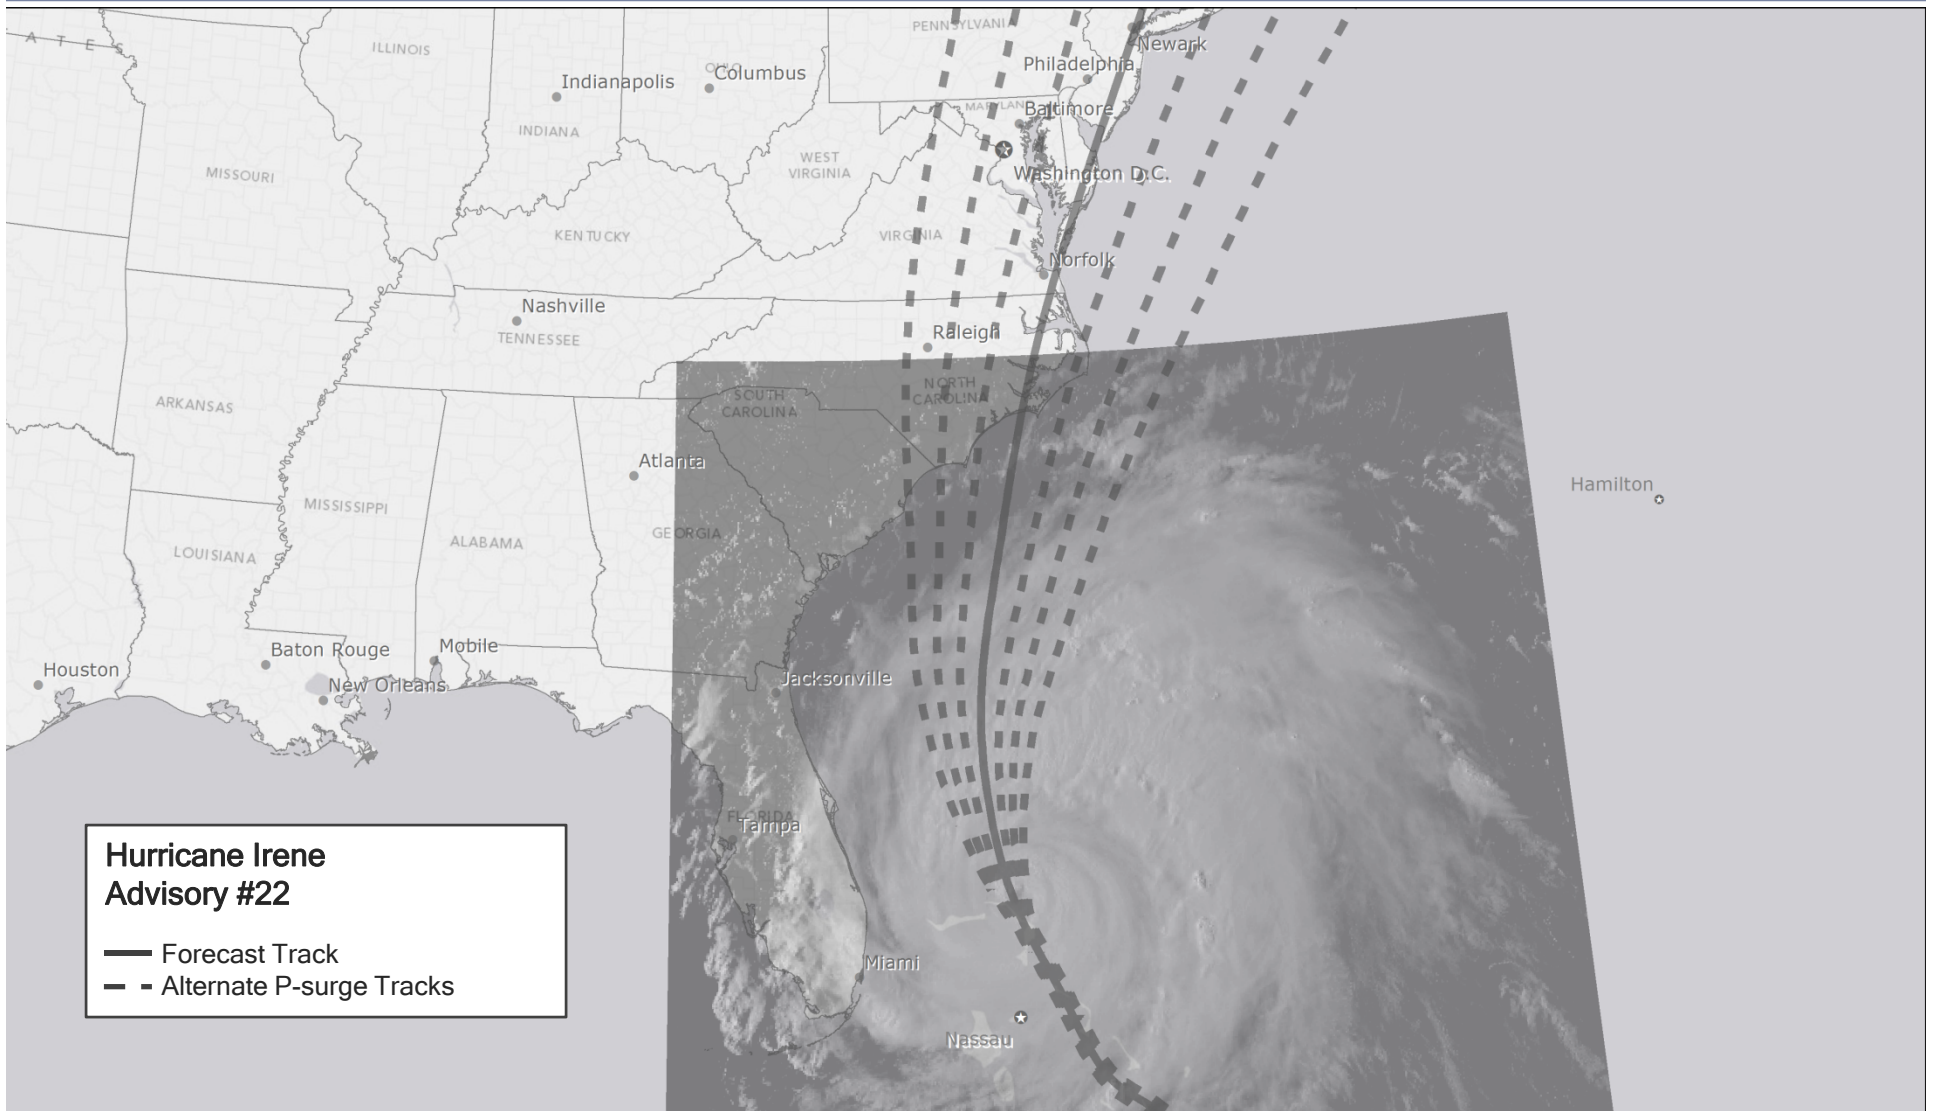

# Probabilistic Storm Surge (P-surge)

- Storm surge probabilities based on NHC official advisory
- Available approximately 48 hours prior to hurricane landfall
- Accounts for uncertainty in:
  - Track / landfall location
  - Size
  - Forward speed
  - Intensity
- Uncertainties based on historical errors

# Probabilistic Storm Surge (P-surge) Multiple Tracks and Landfall Locations

# Probabilistic Storm Surge (P-surge) Multiple Tracks and Landfall Locations

Size: Small, Medium, Large

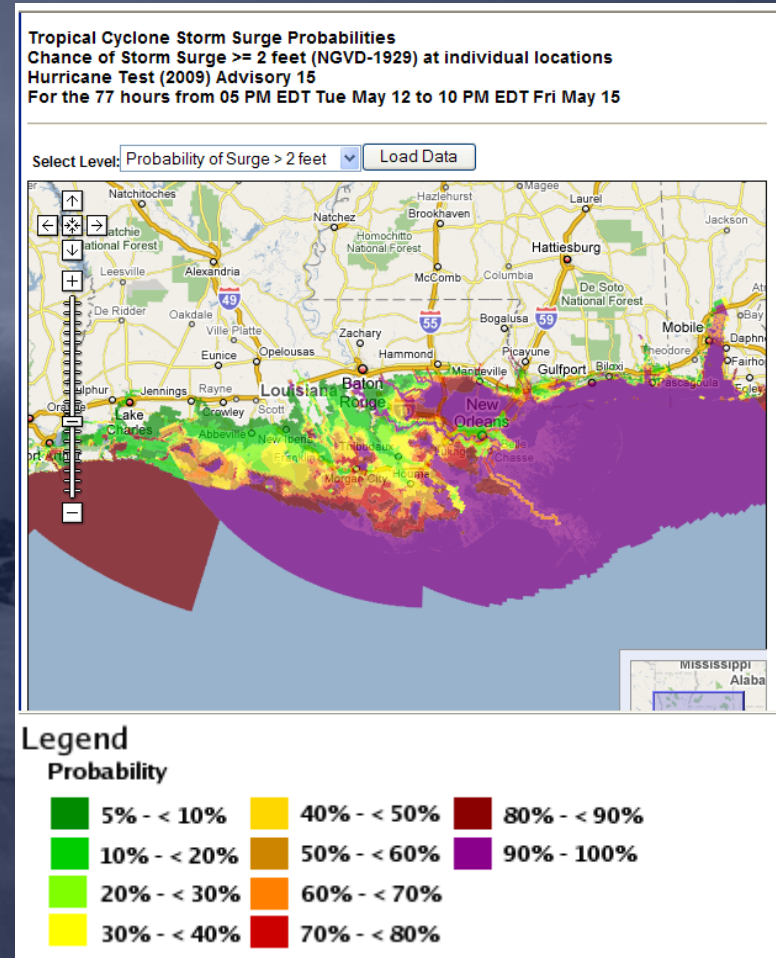

Forward Speed: Fast, Medium, Slow

Intensity: Strong, Medium, Weak

# Probabilistic Storm Surge (P-surge) When is it available?

- Whenever a hurricane watch or warning is in effect
  - Approximately 48 hours prior to landfall
- Available approximately 30 minutes after full advisory release time
  - 05:30 EDT
  - 11:30 EDT
  - 17:30 EDT
  - 23:30 EDT

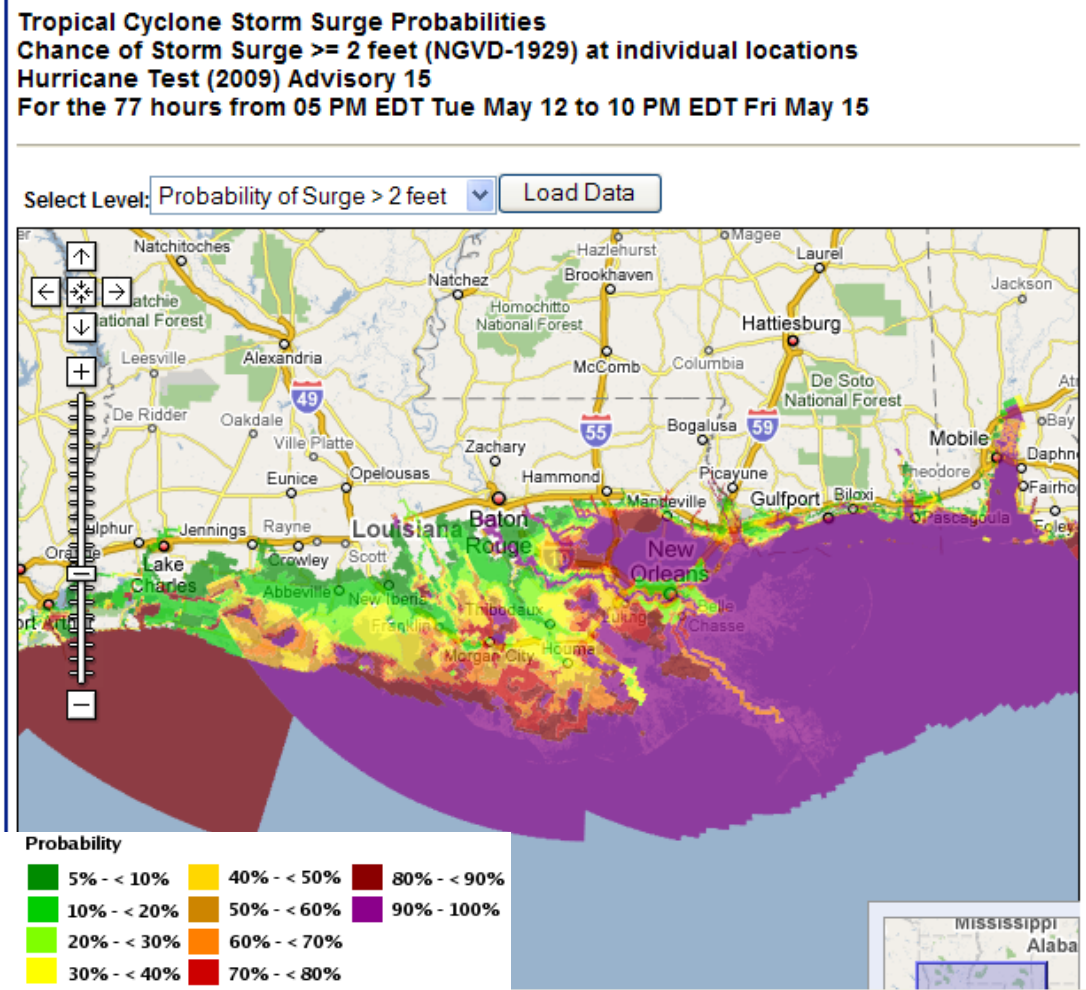

# Understanding and Using Probabilities

The number one argument against using probability is that users do not understand how to interpret low probabilities of an extreme event.

Would you offer to pick up free lunch if there is a 20% chance of you being involved in a fatal car accident along the way?

Basin: Elliptical Mobile Bay <mob>

Storm: c:/slosh/pkg/data/rexfiles/i54\_mob.rex

Envelope of High Water

Deterministic SLOSH run shows limited surge threat to Pensacola area
