

PRELIMINARY REPORT
Tropical Depression Fourteen
9-13 September 1995

Lixion A. Avila
National Hurricane Center
24 November 1995

Tropical Depression Fourteen developed from a distinct tropical wave which exited the coast of Africa on 4 September. The system gradually organized and became a tropical depression at 1200 UTC 9 September. It was the only tropical depression which formed and did not reach tropical storm status in the eastern Atlantic. The depression moved toward the northwest and encountered strong upper-level winds which removed the convection from the low-level center.

The best track positions of tropical Depression Fourteen is shown in Fig. 1. Table 1 is a listing, at six-hour intervals, of the best-track position, estimated minimum central pressure and maximum 1-minute surface wind speed.

Table 1. Preliminary best track, Tropical Depression Fourteen, 9-13 September, 1995

Date/Time (UTC)	Position		Pressure (mb)	Wind Speed (kt)	Stage
	Lat. (°N)	Lon. (°W)			
9/1200	17.9	41.9	1009	25	Tropical Depression
