Administrative Details

- **Course application – FF119-25-2**
 - Must have an SID# (replaces SSN)
 - Include your email address
 - Sign the application
- **EMI Evaluation Form (scantron)**
 - Evaluate instruction and content
 - Provide comments and suggestions
- **EMI certificate**
 - Must attend the entire course to receive credit
 - EMI certificates will be sent via email

L-311

FEMA Student Identification (SID)

<https://cdp.dhs.gov/femasid>

- **Click on “Register for a FEMA SID”**
 - Follow instructions and *you will receive an email with your SID #*
- **If you think you have an SID**
 - Call 866-291-0696

L-311

Evaluations

Appropriate wording includes;

“This has been the best learning experience!”

“The instructors totally blew me away with their insightful knowledge and presentation skills.”

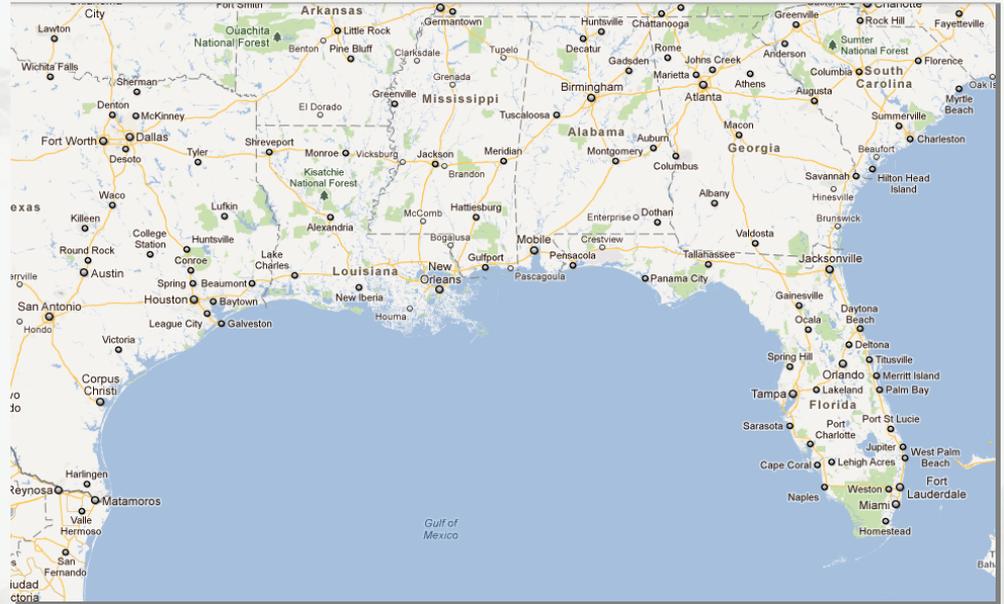

“I feel 1000% ready for the next hurricane threat.”

“You had me at “hurricanes.”

Agenda

830 AM - 10 AM

Hurricane Basics: Lifecycle, Climatology and Hazards

1030 AM - Noon

There is a Storm. What's the Info?

130 PM - 3 PM

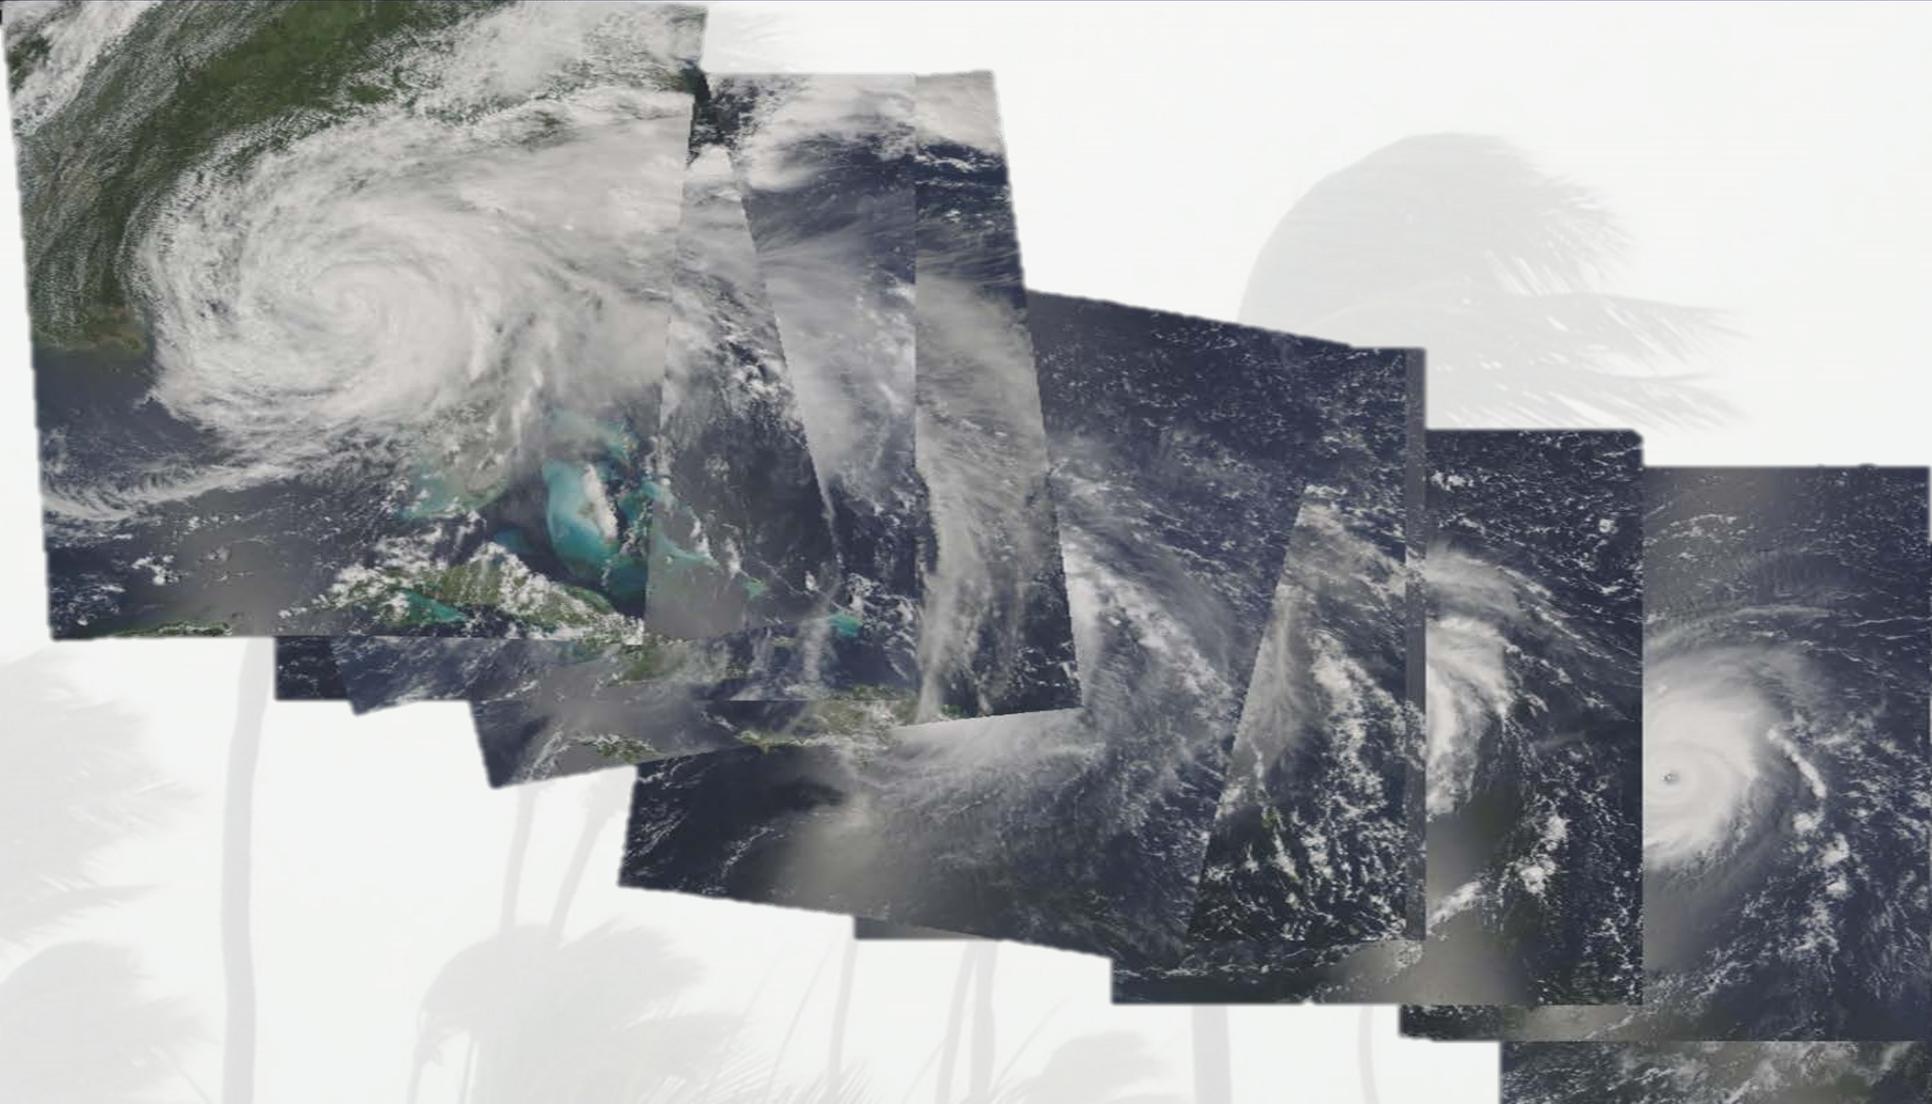

Forecast Uncertainty. What, Me Worry?

330 PM - 5 PM

Making Better Decisions

Hurricane Basics

Life Cycle. Climatology. Hazards.

Tropical Cyclones

Hurricane. Typhoon. Tropical Storm.

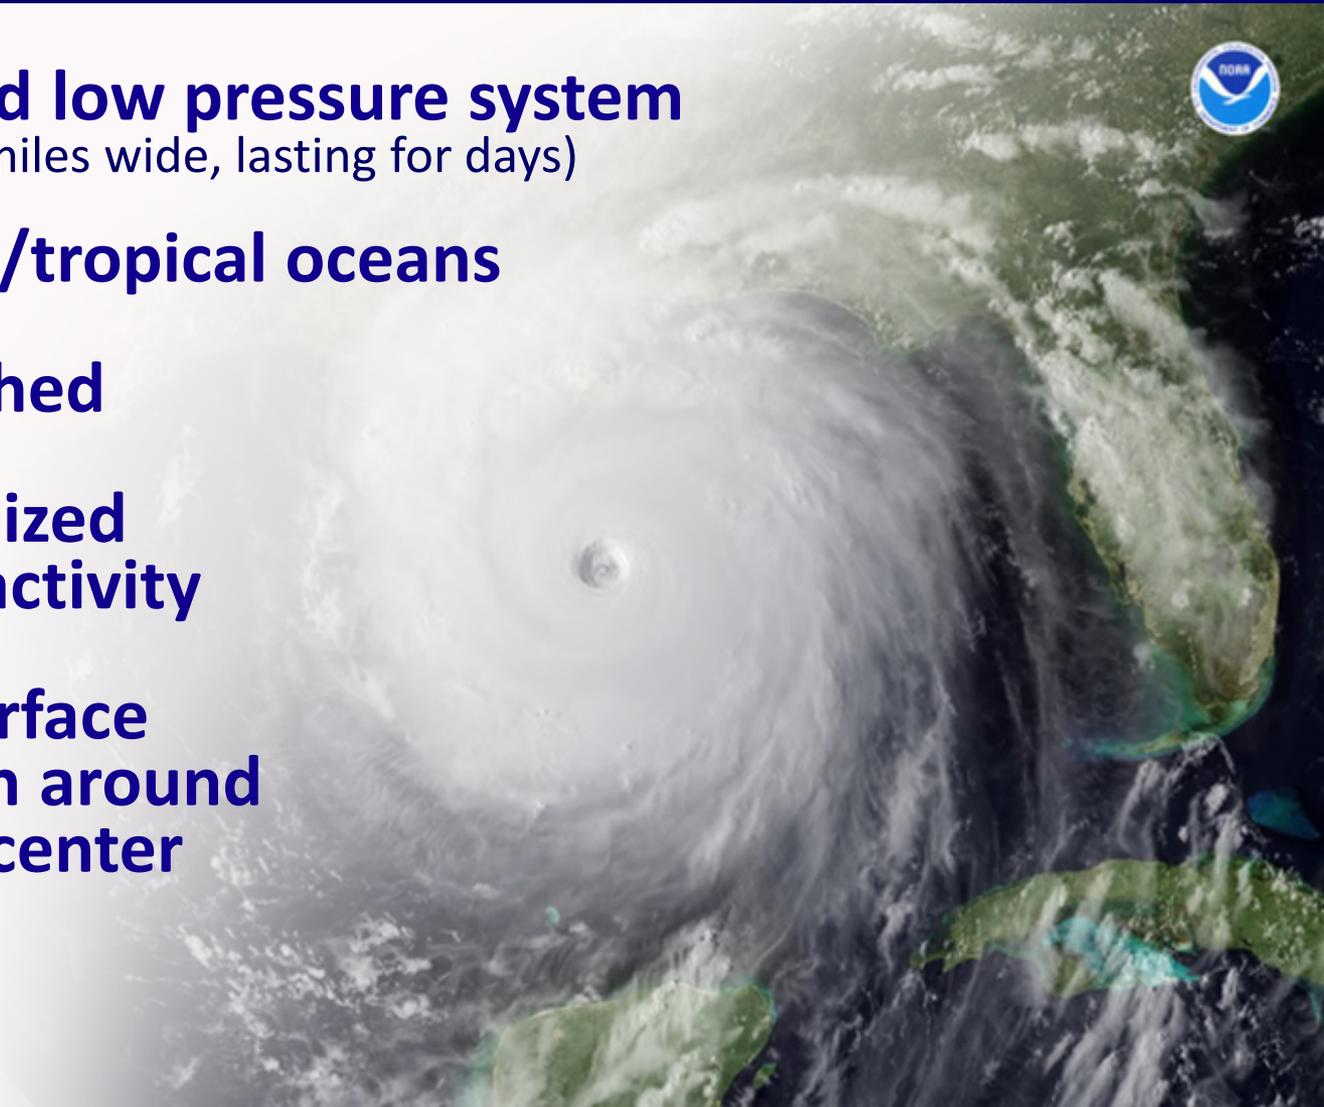

1. Large, long-lived low pressure system
(Can be hundreds of miles wide, lasting for days)

2. Forms over sub/tropical oceans

3. No fronts attached

**4. Produces organized
thunderstorm activity**

**5. Has a closed surface
wind circulation around
a well-defined center**

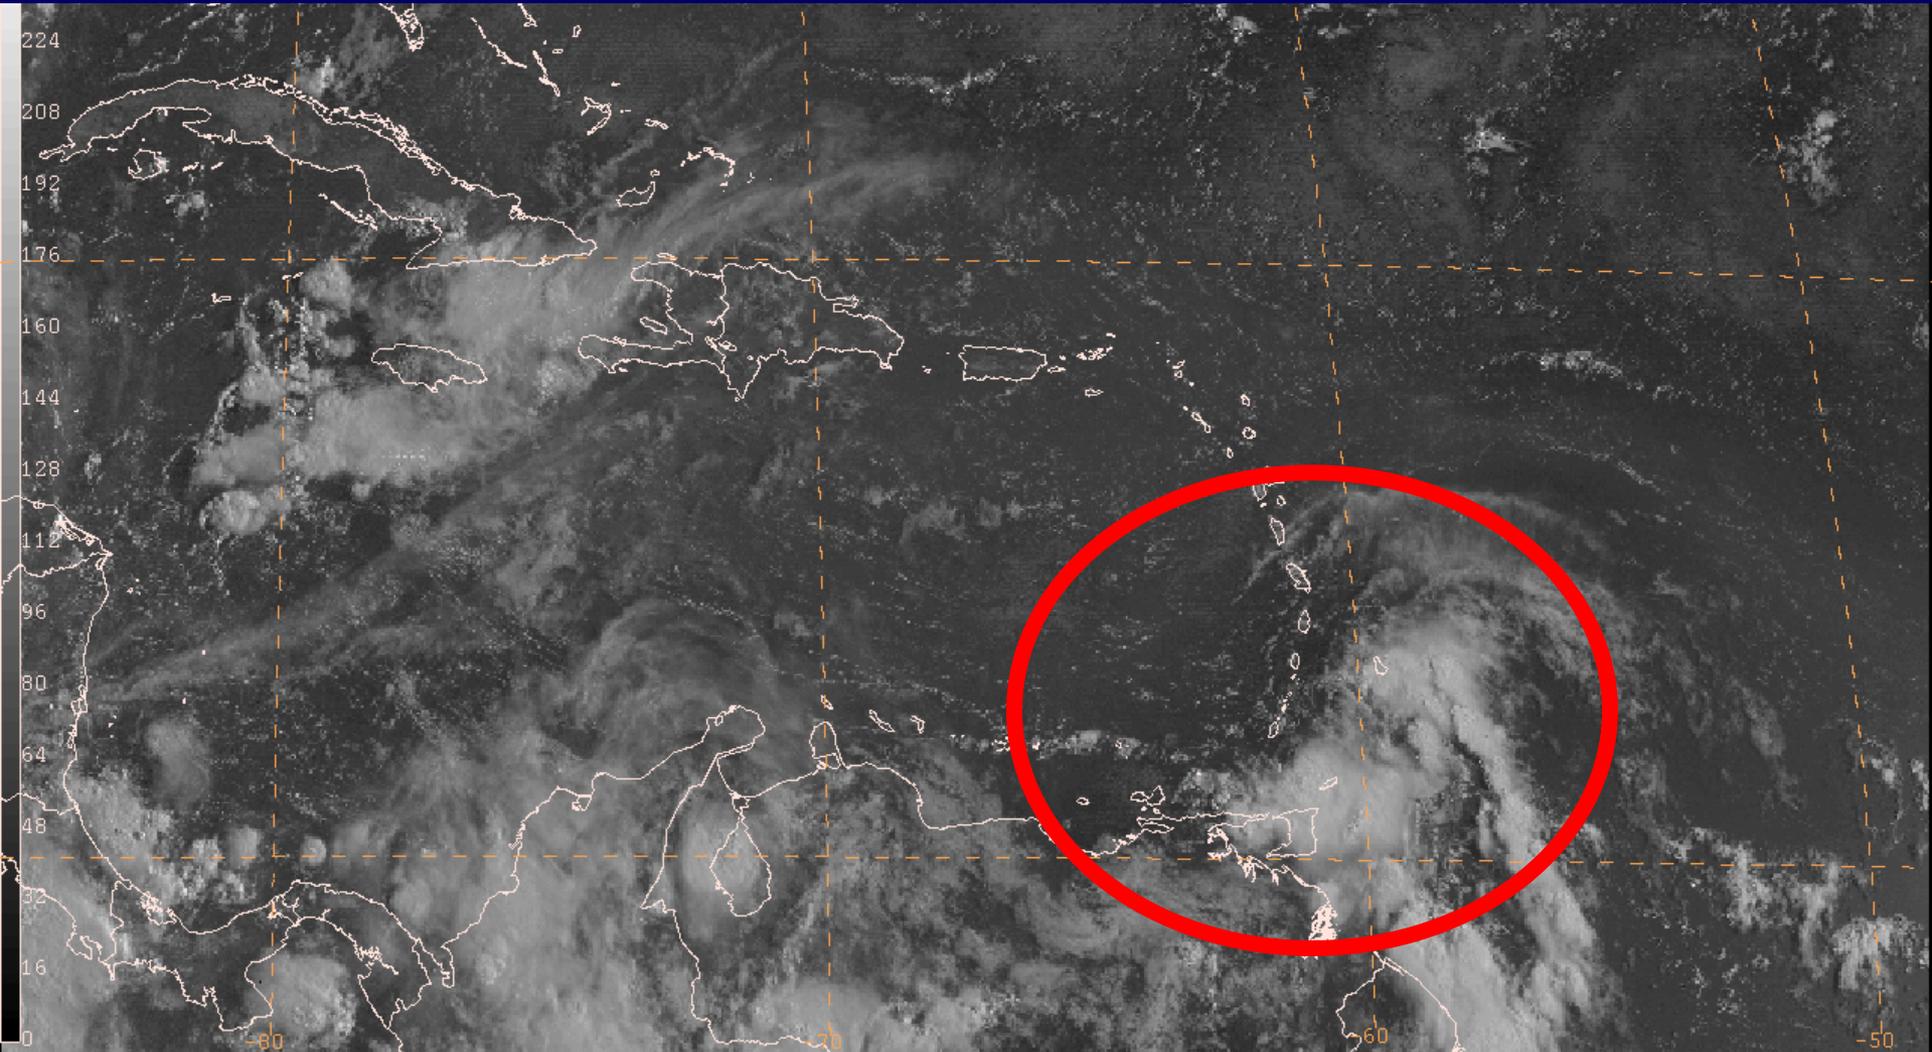

Tropical Cyclones

Classified by Maximum Wind Speed

- Tropical Depression: < 39 mph
- Tropical Storm: 39-73 mph
- Hurricane: 74 mph or greater
 - Major Hurricane: 111 mph or greater

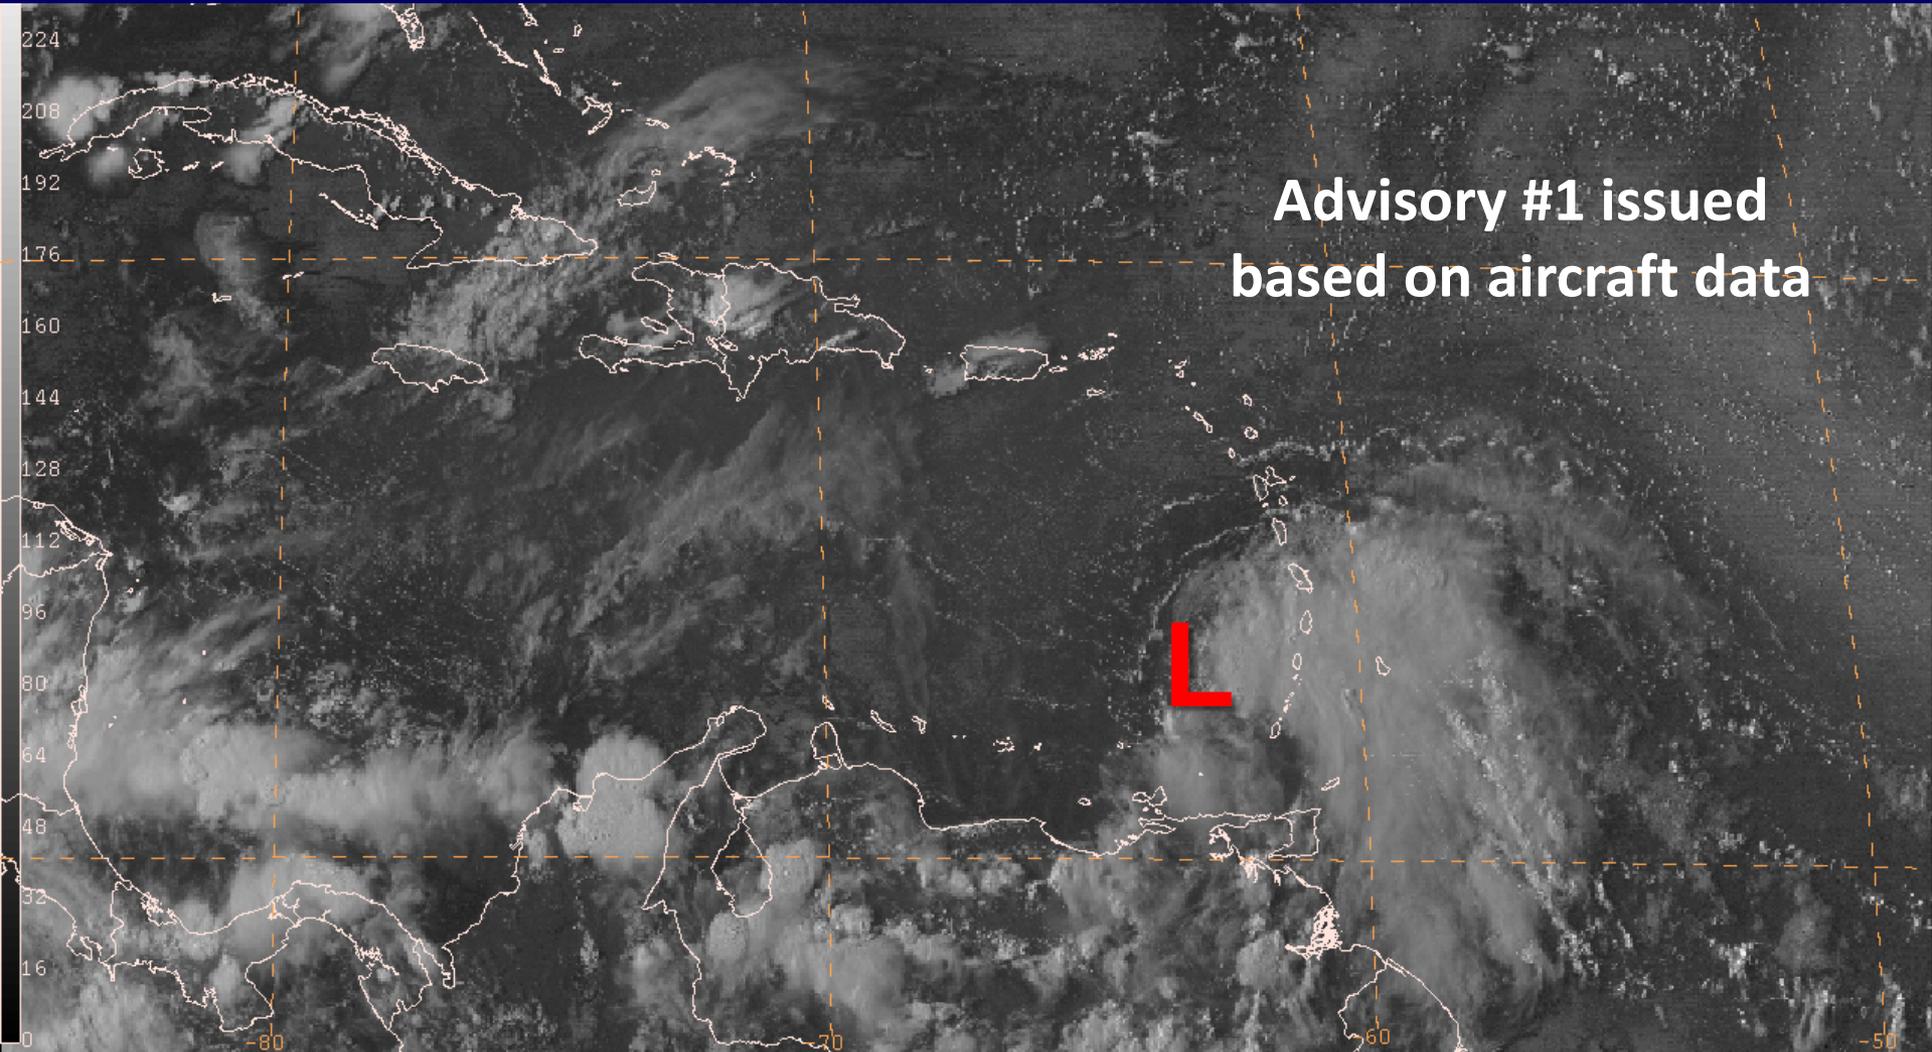

Tropical Cyclones

Surface Circulation? Organized?

Tropical Cyclones

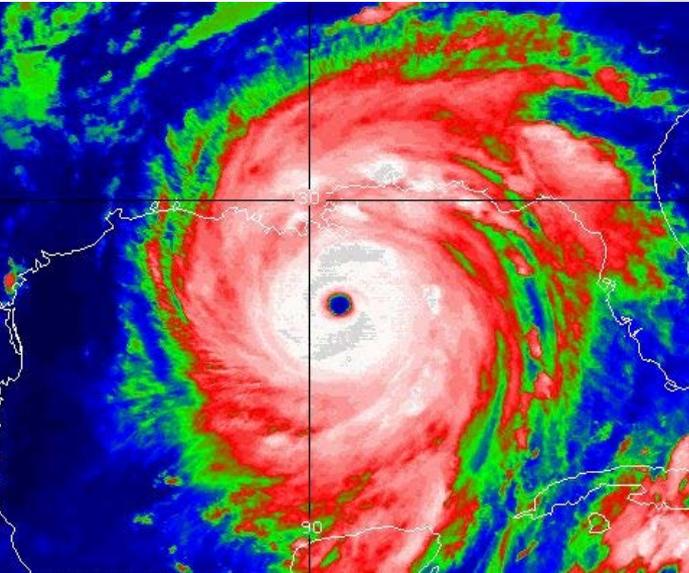

Ernesto 2006

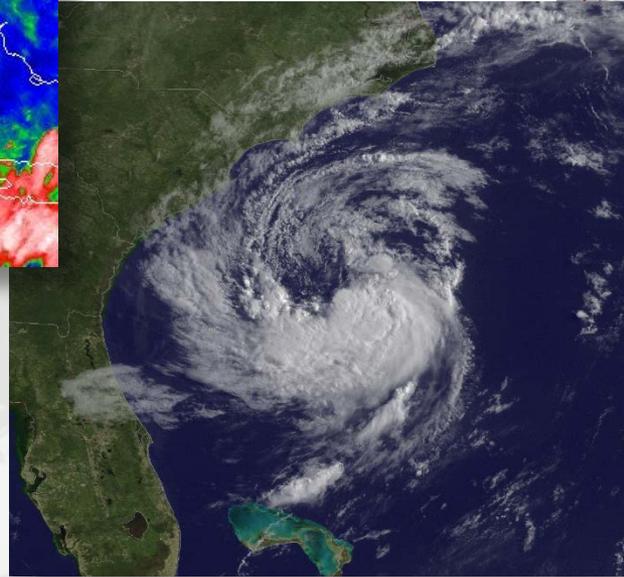

**Advisory #1 issued
based on aircraft data**

Cyclones

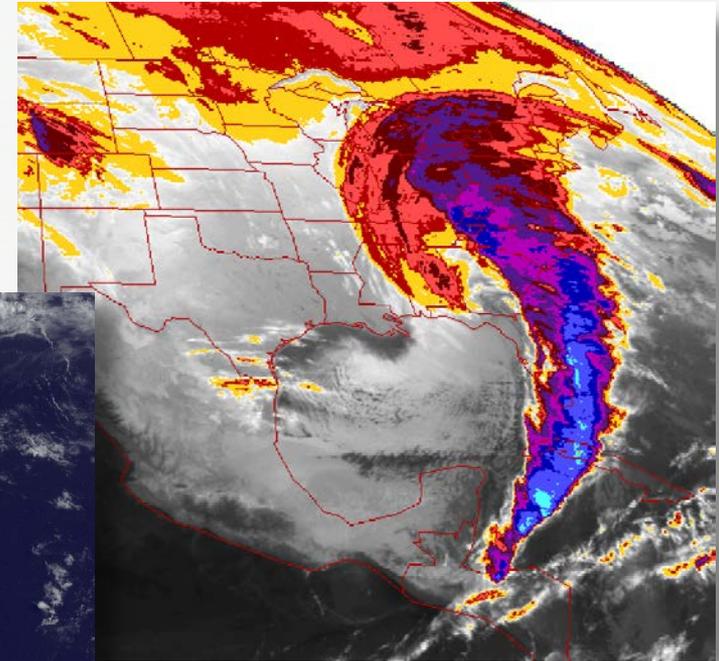

Tropical, Subtropical and Extratropical

Hurricane Katrina 2005

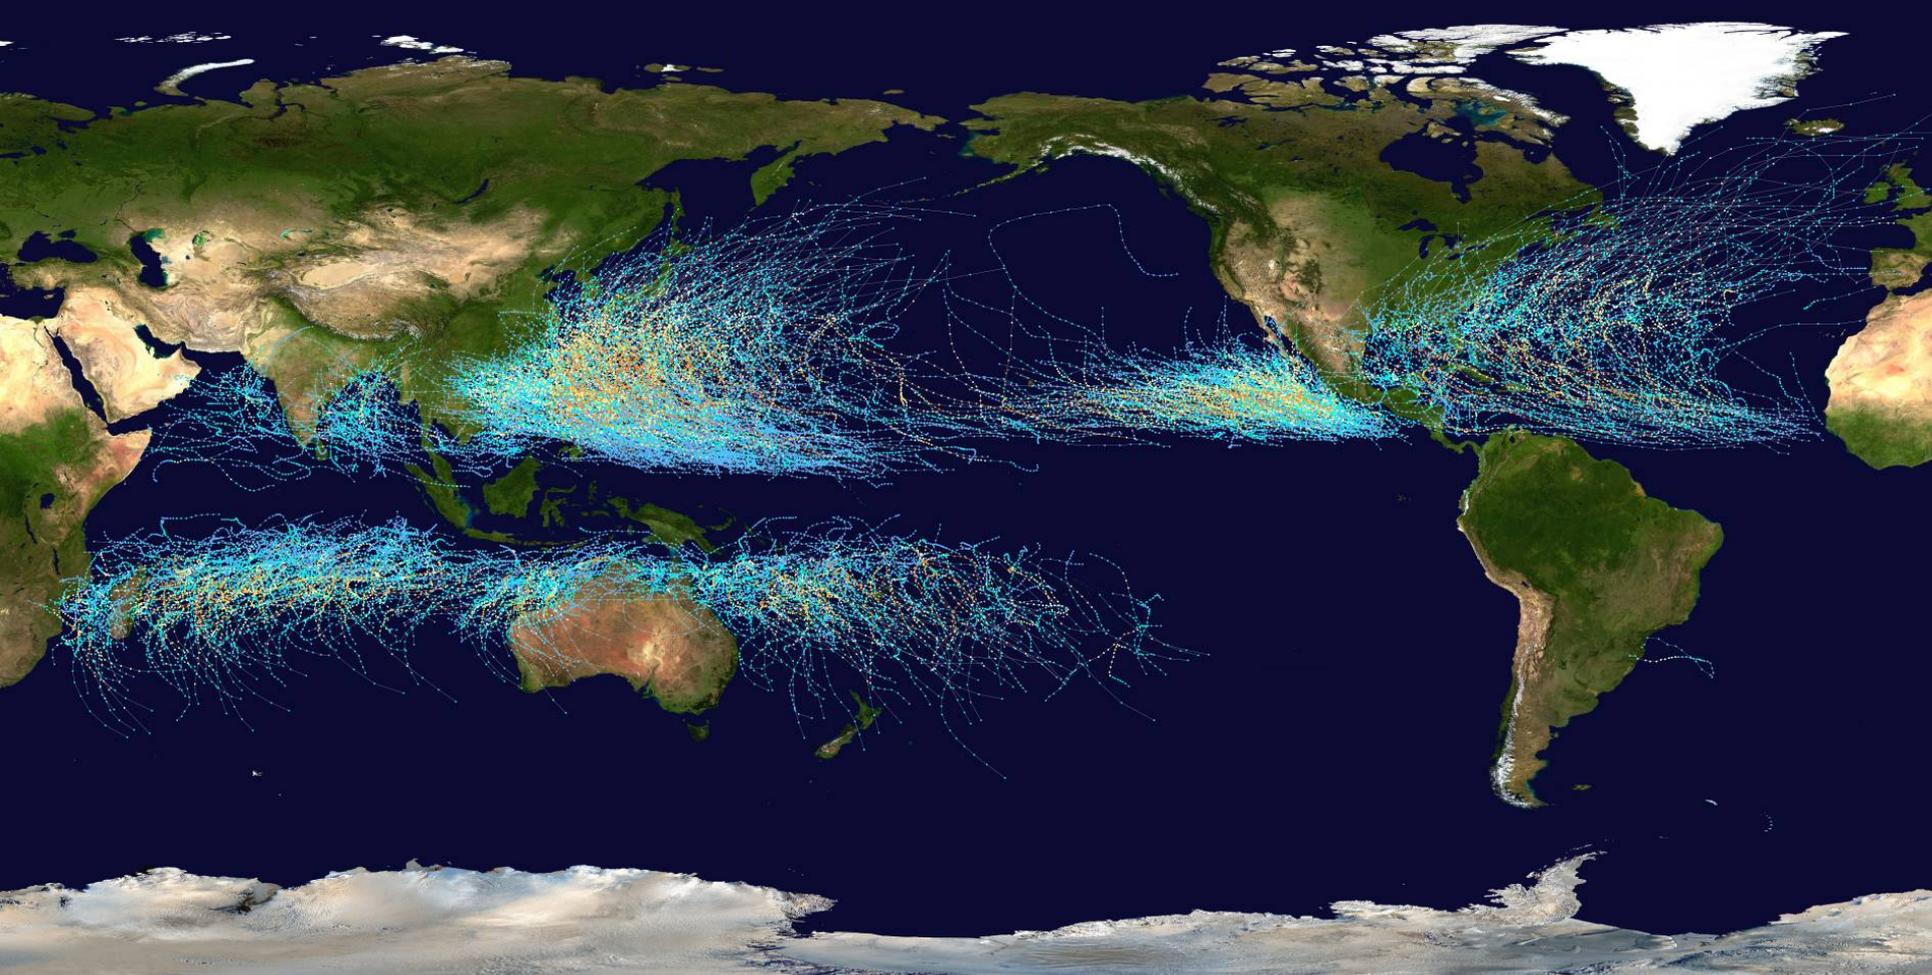

Subtropical Storm Ana 2015

March Superstorm 1993

Tropical Cyclones

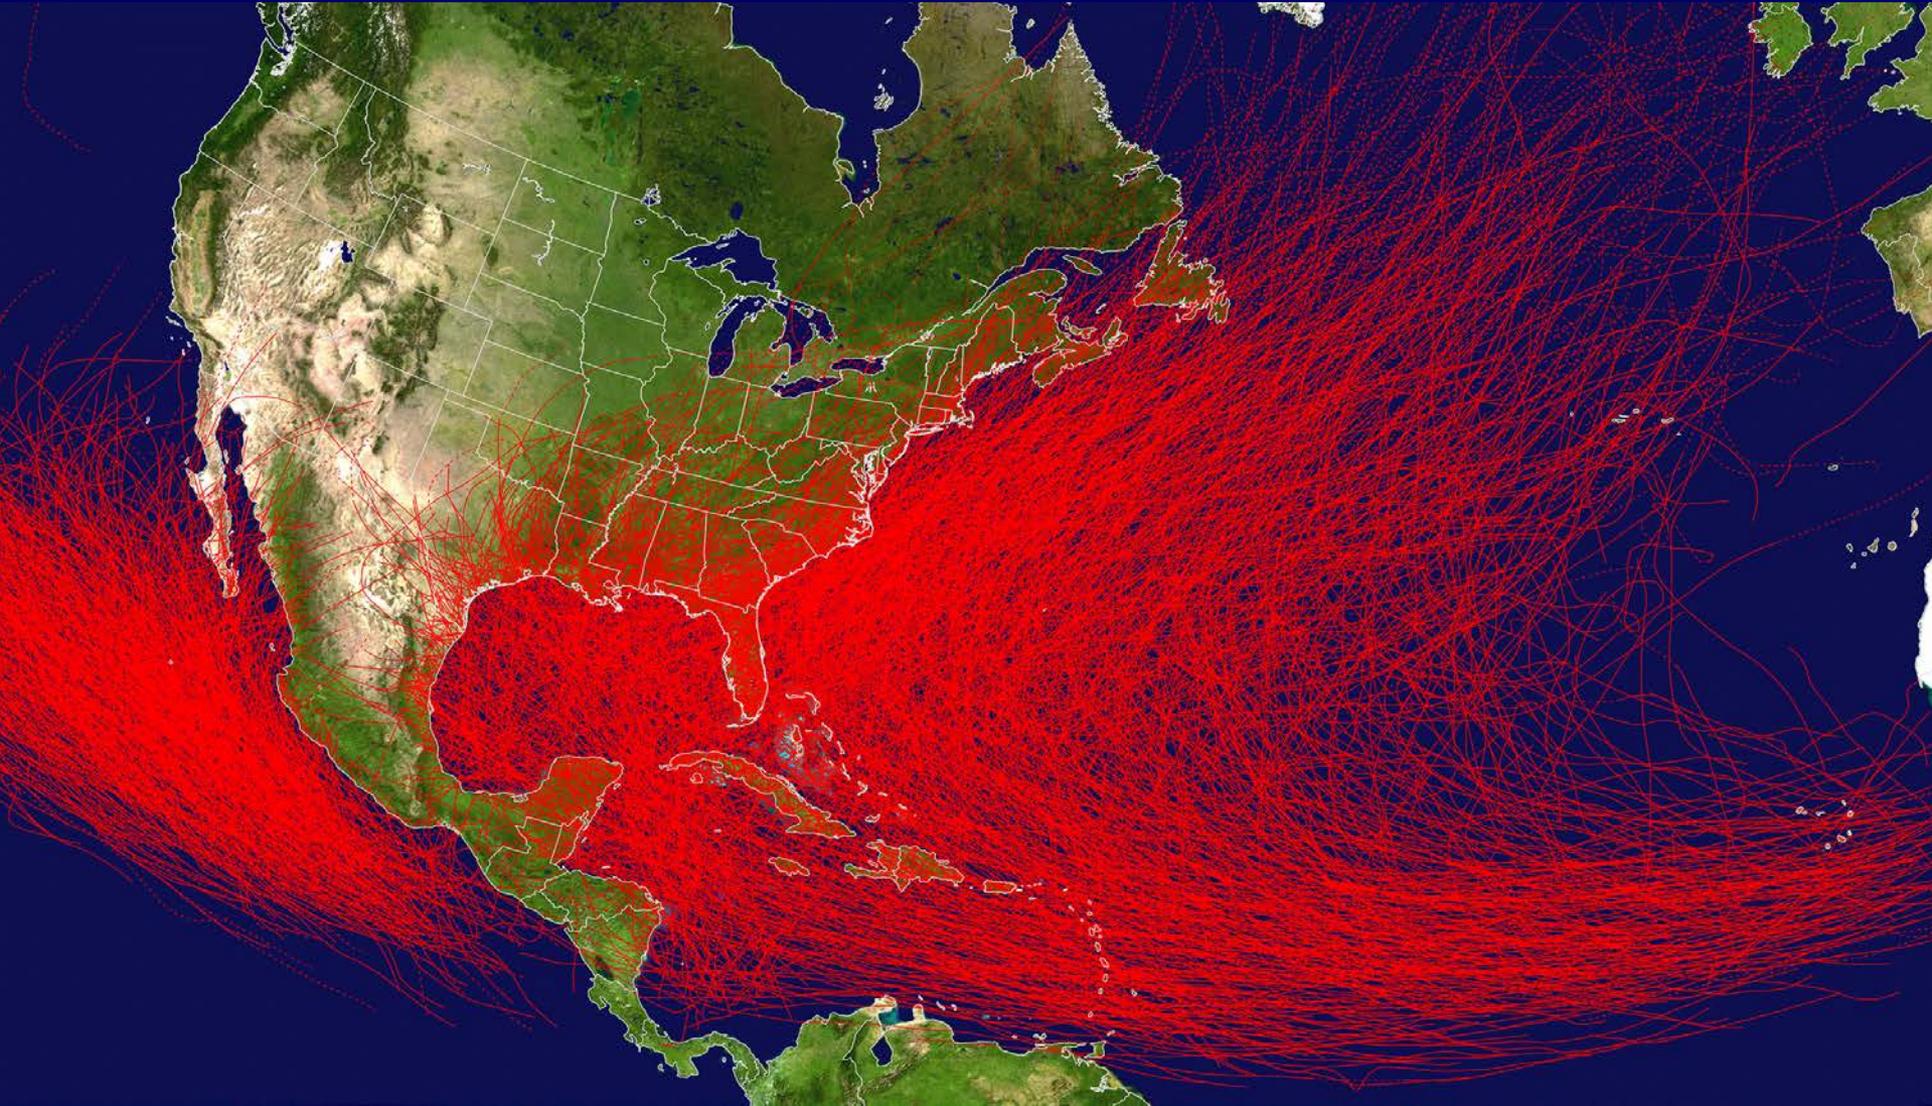

Tropics / Subtropics around the World

Tropical cyclone tracks 1985 – 2005

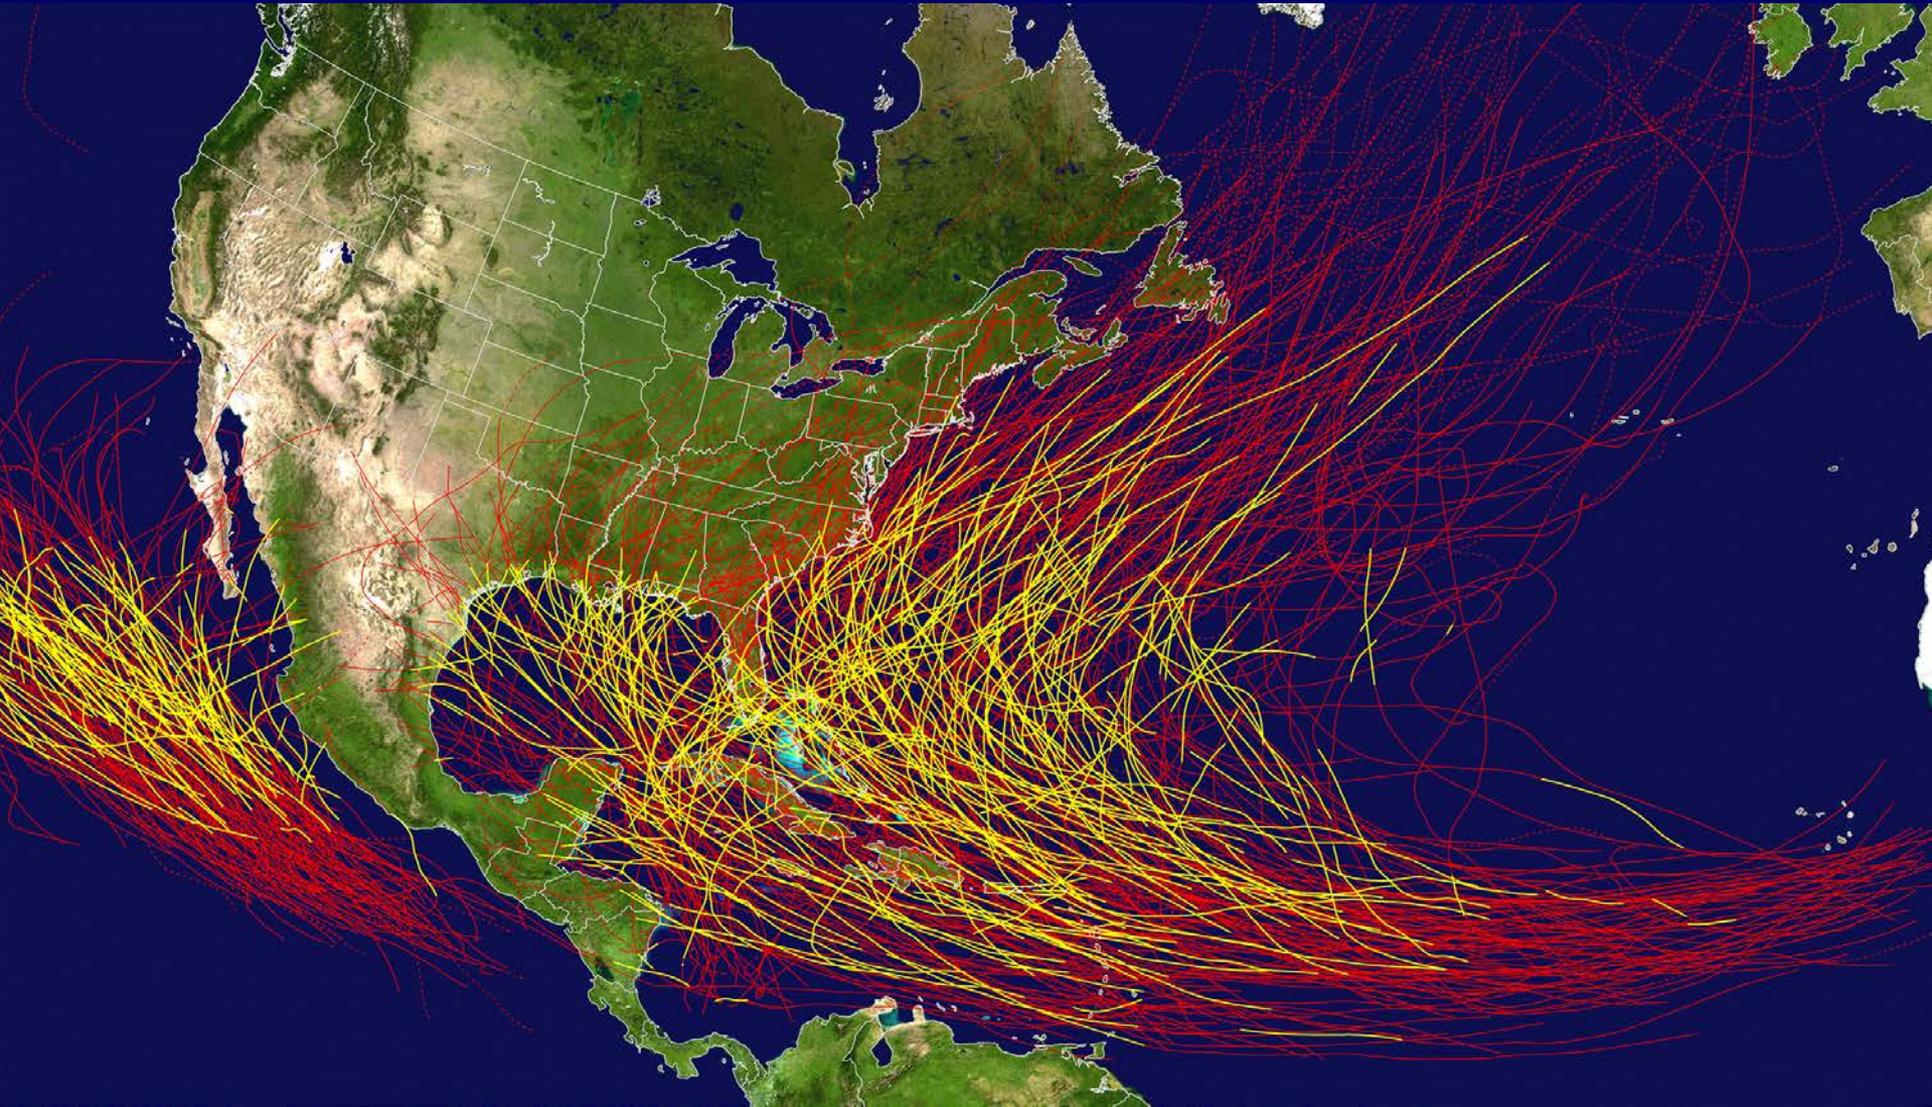

Tropical Cyclones

Atlantic since 1851. Pacific since 1949.

Major Hurricanes

Atlantic since 1851. Pacific since 1949.

Hurricane Quiz

What month has the most hurricane activity in the Atlantic?

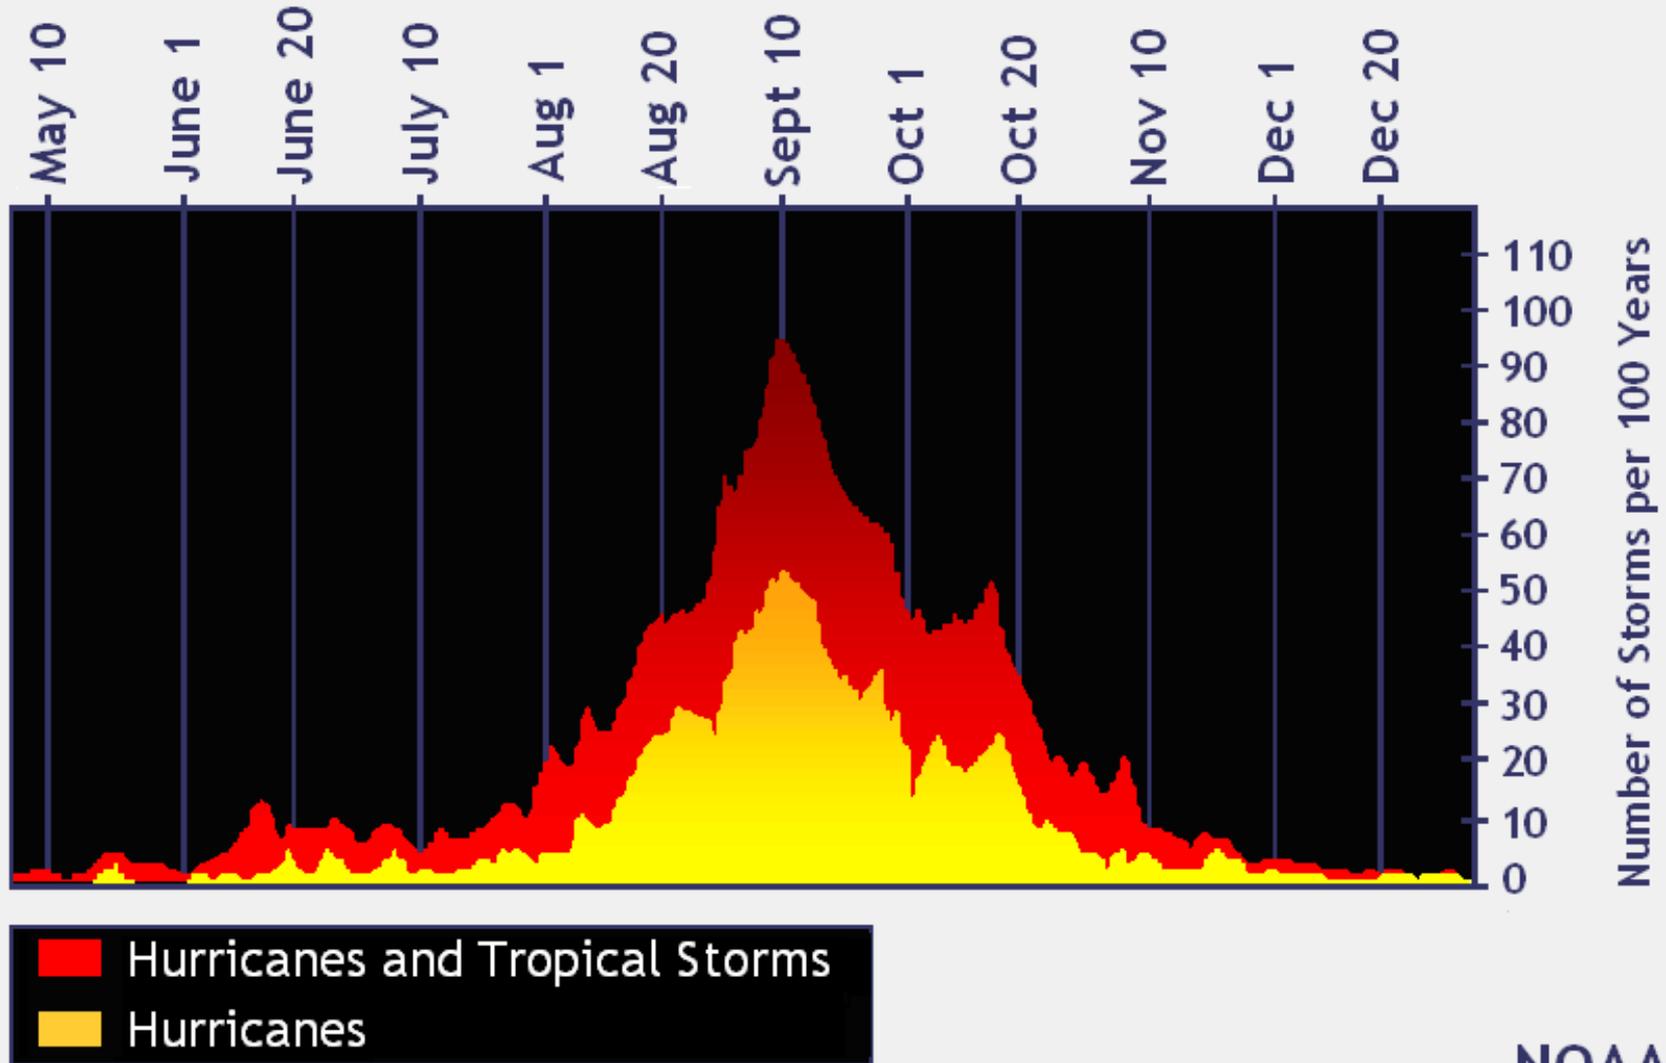

- A. December**
- B. August**
- C. June**
- D. September**

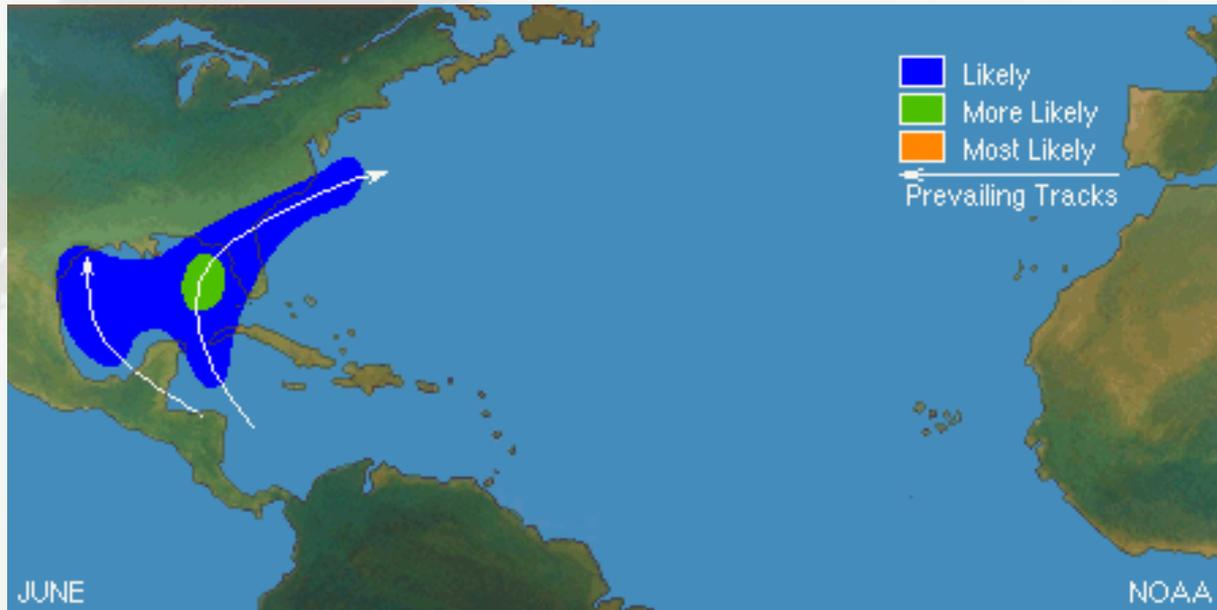

Climatology

Atlantic Hurricanes & Tropical Storms

Climatology

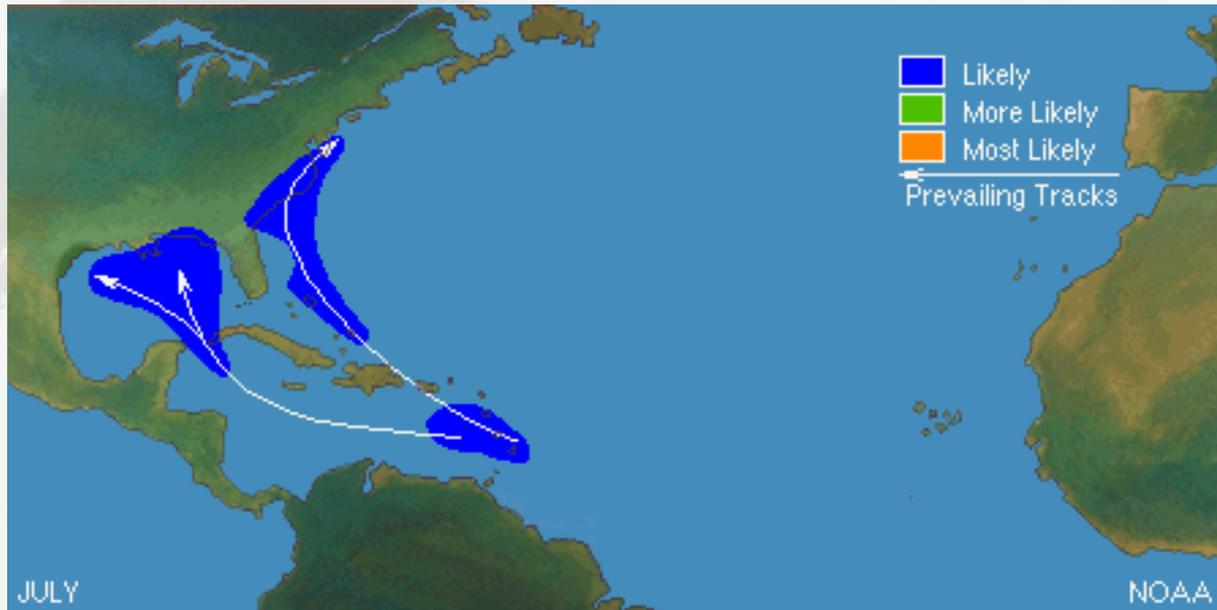

June Formation Areas

- On average about 1 storm every other year.
- Most June storms form in the NW Caribbean Sea or Gulf of Mexico.

Climatology

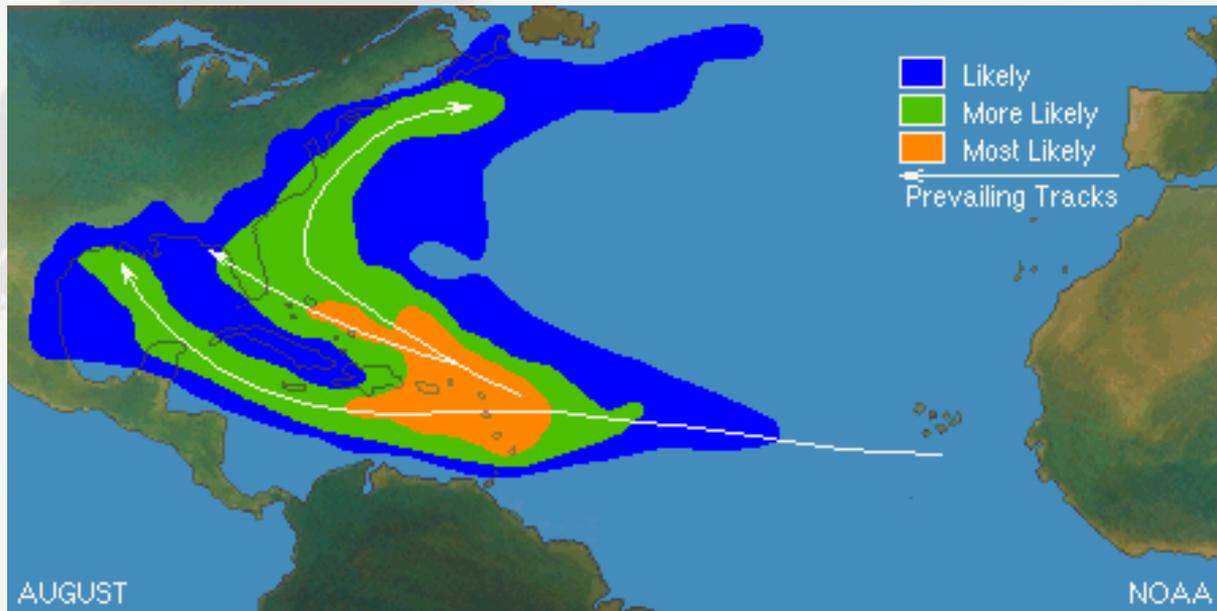

July Formation Areas

- On average about 1 storm every year.
- July development areas spread east and covers the western Atlantic, Caribbean, and Gulf of Mexico.

Climatology

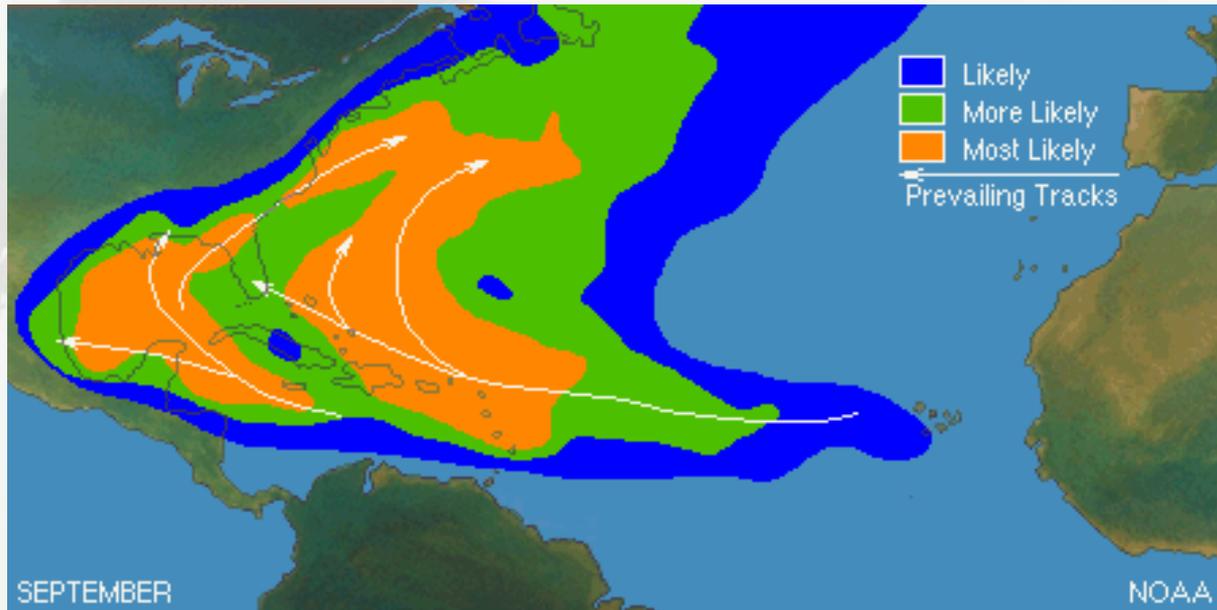

August Formation Areas

- On average about 2-3 storms form each year.
- The Cape Verde season usually begins in August.

Climatology

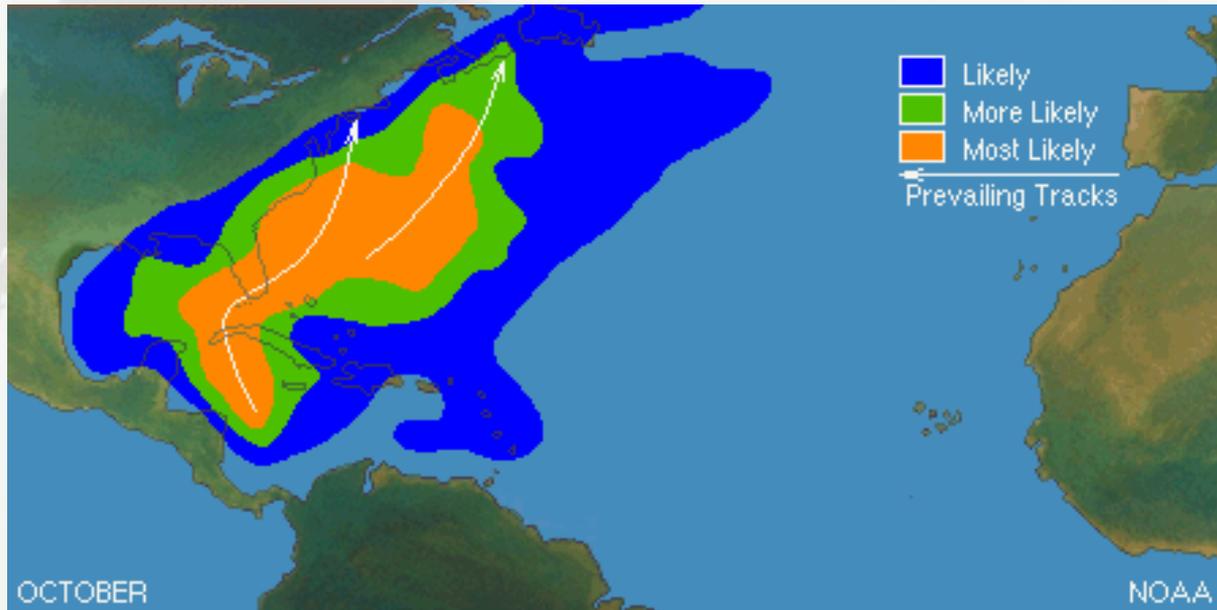

September Formation Areas

- **September is the climatological peak of the season.**
- **Storms can form nearly anywhere in the basin;
Long track Cape Verde storms.**

Climatology

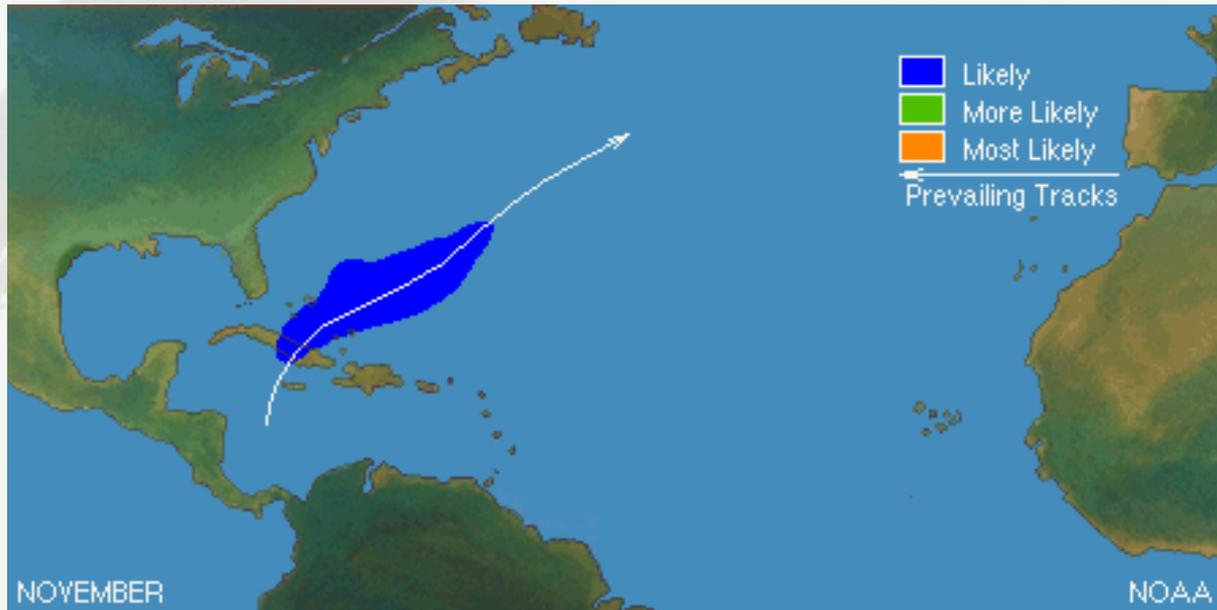

October Formation Areas

- **Secondary peak of season in mid-October.**
- **Cape Verde season ends. Development area shifts back to the Gulf, Caribbean and western Atlantic.**

Climatology

November Formation Areas

- On average about 1 storm ever other year.
- Storms that do form typically develop in central Caribbean or western Atlantic.

Hurricane Quiz

Which of these are ingredients for hurricane development?

- A. Warm Water**
- B. Cold Air**
- C. Lots of Moisture**
- D. Strong Winds Aloft**
- E. Icebergs**

Hurricane Lifecycle

Ingredients for Formation

Building Blocks

- 1) A pre-existing disturbance (vorticity or spin)

- 2) Location several degrees north of the equator

- 3) Little change in wind speed and/or direction with height (vertical wind shear)

Fuel

- 4) Warm sea-surface temperatures (usually at least 80°F)

- 5) Unstable atmosphere (temperature goes down as you go up)

- 6) High atmospheric moisture content (relative humidity)

Hurricane Forecasting

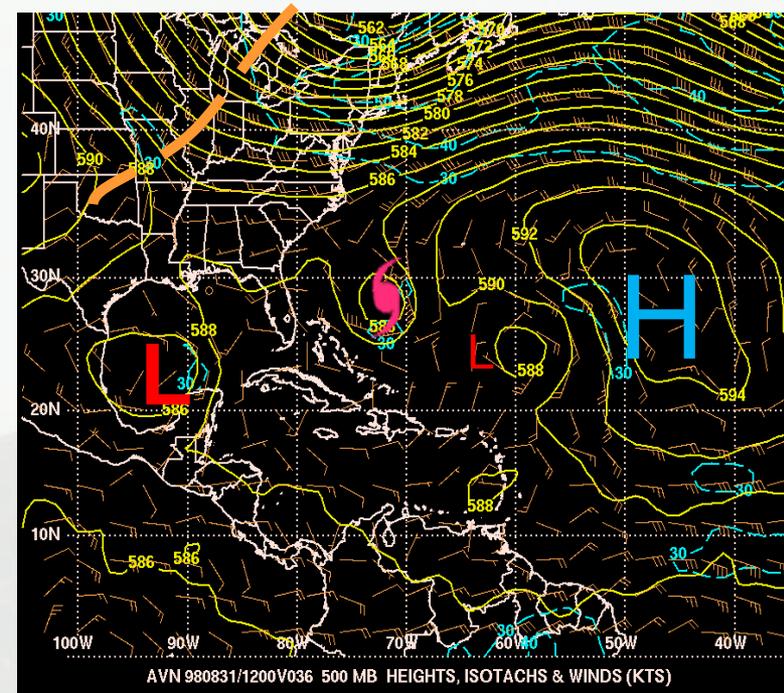

Pre-Existing Disturbances

- **Tropical waves**
 - About 70% of all Atlantic basin formations
 - Most major hurricanes
- **Decaying cold fronts**
 - Formation often near Gulf and SE States
 - Typically early or late season storms
- **Non-tropical lows and thunderstorm complexes**
 - Often subtropical systems

Hurricane Forecasting

Storm Motion and Track

- **Track forecasting is usually controlled by large-scale weather features.**
 - Cork in stream analogy
- **Numerical computer models forecast track quite well**
 - Constantly upgrading model physics and resolution
 - Long ago surpassed statistical models in accuracy

Hurricane Forecasting

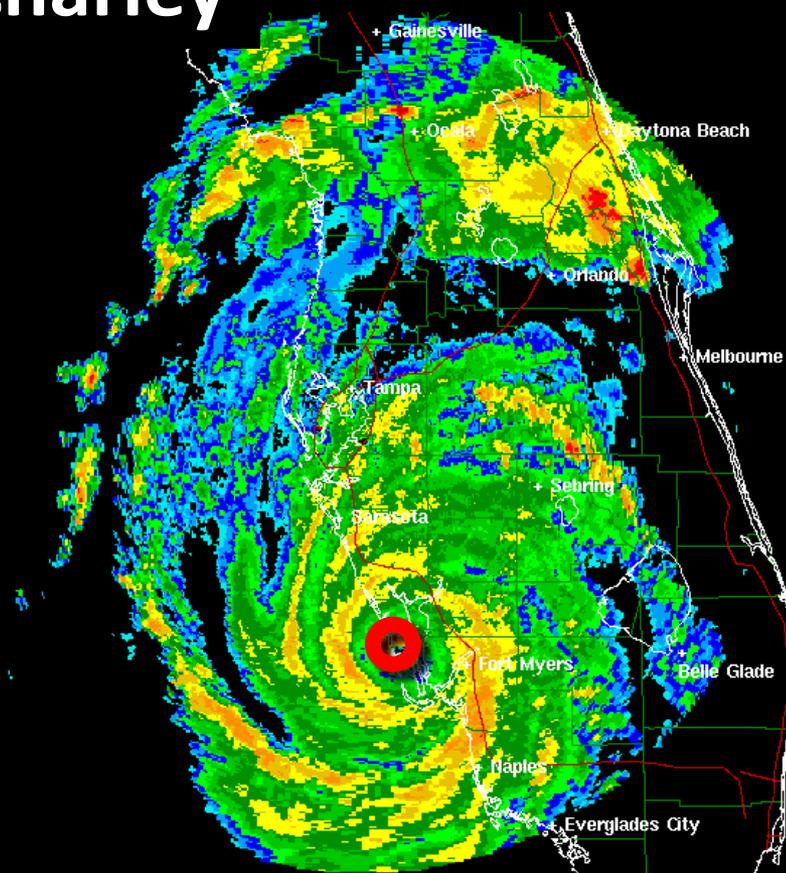

Factors that Influence Intensity

- **Upper Ocean Temperatures**
More heat favors a stronger storm
- **Interaction with Land/Topography**
More land increases weakening
- **Vertical Wind Shear**
Shear limits strengthening
- **Moisture in Storm Environment**
Dry air can limit strengthening
- **Structural Changes, Eyewall Replacement**
Difficult to forecast and not straightforward
- **Interactions with other weather systems**

Hurricane Forecasting

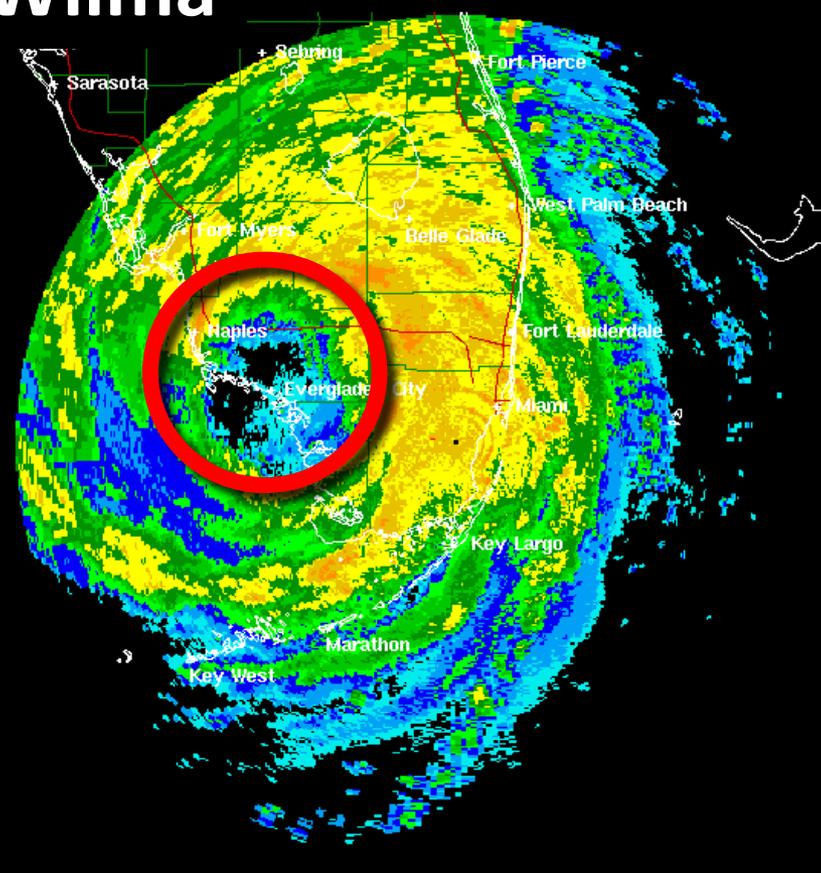

One Size Does Not Fit All

Wilma

Radar Image from National Weather Service: KAMX 11:13 UTC 10/24/2005

Hurricane Quiz

Which hurricane hazard has the greatest potential for large loss of life?

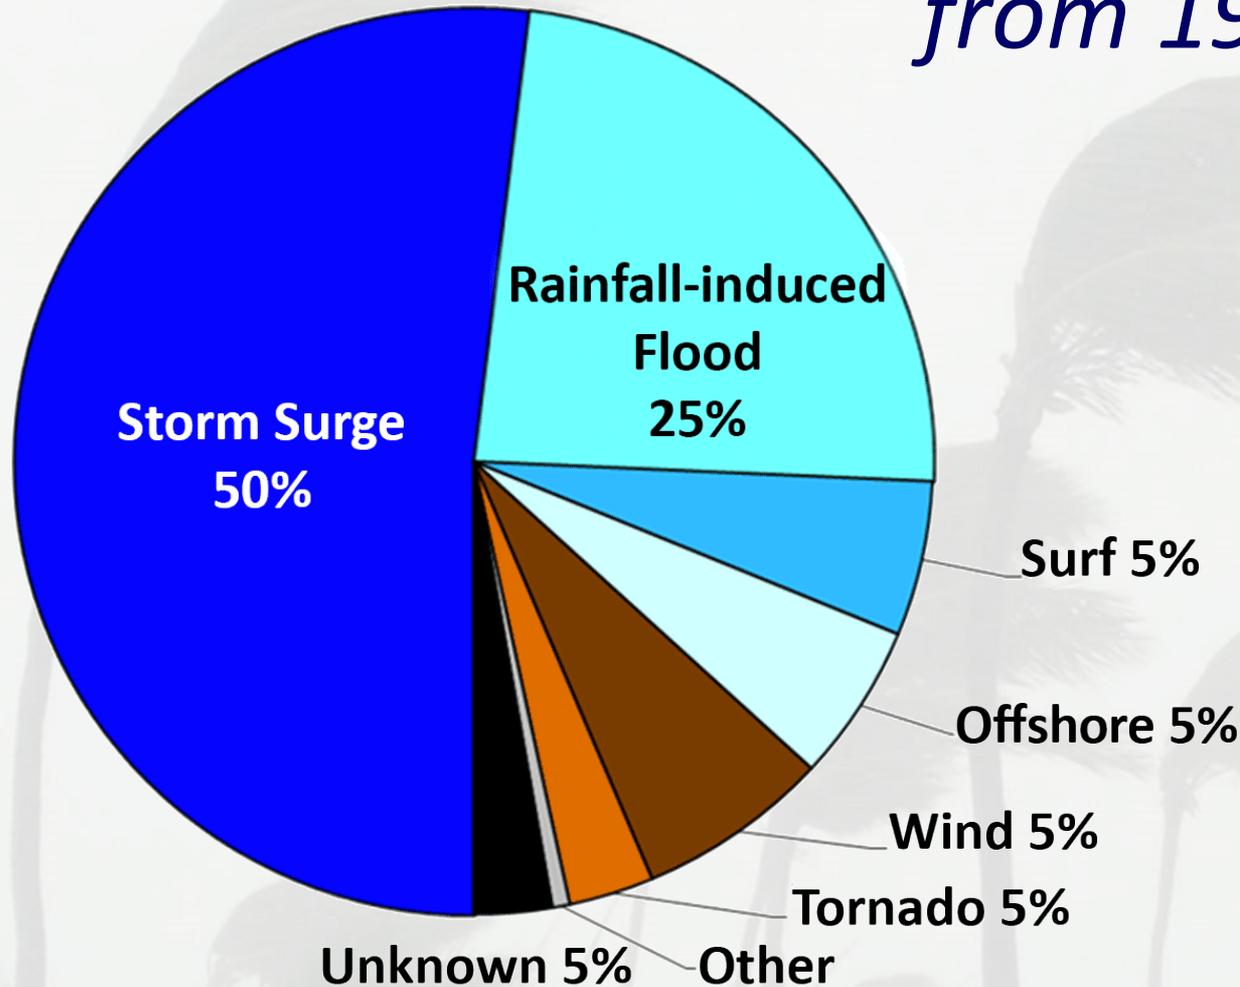

- A. Wind**
- B. Rain induced flooding**
- C. Tornadoes**
- D. Storm Surge**

U.S. Tropical Cyclone Deaths

Water is responsible for vast majority

from 1963 - 2012

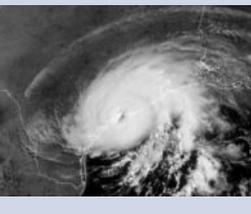

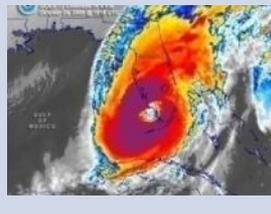

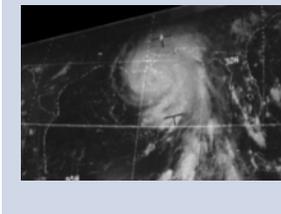

Hurricane Hazards

Surge. Wind. Flood. Tornado. Waves.

Saffir-Simpson Scale

Estimates Wind Damage

			MAJOR HURRICANES		
Tropical Storm	Category 1	Category 2	Category 3	Category 4	Category 5
39-73 mph (34-63 kt)	74-95mph (64-82 kt)	96-110 mph (83-95 kt)	111-129 mph (96-112 kt)	130-156 mph (113-136 kt)	> 156 mph (> 136 kt)
					
Debby (2012)	Isaac (2012)	Ike (2008)	Katrina (LA - 2005)	Charley (2004)	Andrew (1992)
					
Allison (2001)	Claudette (2003)	Isabel (2003)	Wilma (FL- 2005)	Hugo (1989)	Camille (1969)

Cat 1 (74 – 95 mph)

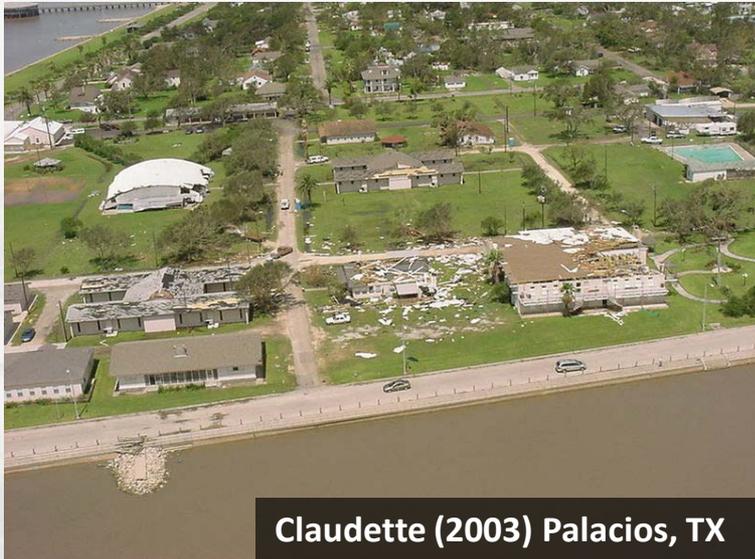

Dangerous Winds. Some Damage.

Humberto (2007) Southeast TX

Katrina (2005) Miami, FL

Claudette (2003) Palacios, TX

Lili (2002) Louisiana

Cat 2 (96 – 110 mph)

Extremely Dangerous. Extensive Damage.

Ike (2008) Houston, TX

Wilma (2005) SE Florida

Juan (2003) Halifax, NS

Cat 3 (111 – 129 mph)

Devastating Damage

Rita (2005) Orange, TX

Jeanne (2004) Cape Canaveral, FL

Rita (2005) Orange, TX

Cat 4 (130 – 156 mph)

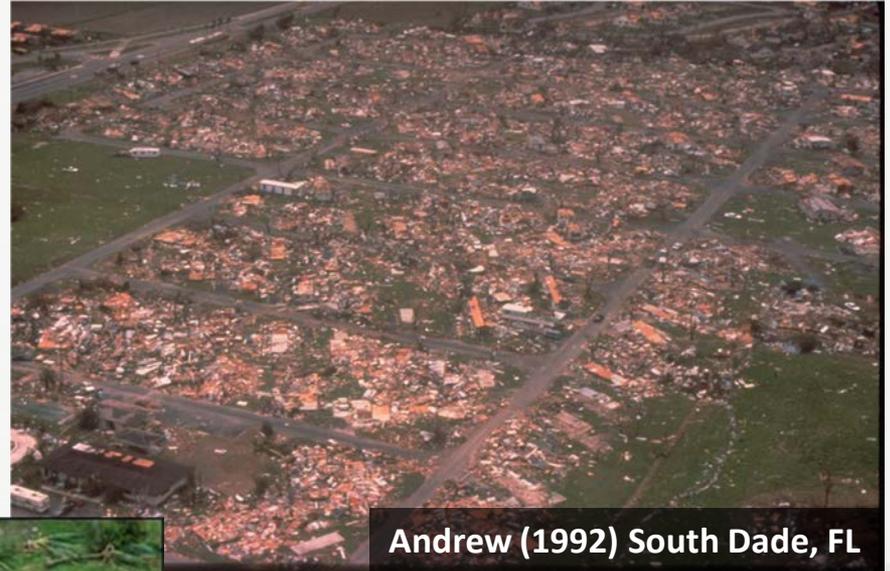

Catastrophic Damage

Cat 5 (> 156 mph)

Catastrophic Damage

Andrew (1992) Florida City, FL

Andrew (1992) South Dade, FL

Felix (2007) Nicaragua

Storm Surge

Greatest potential for large loss of life.

Hurricane Sandy (2012)

73 deaths

\$65 billion damage

Hurricane Katrina (2005)

1200 deaths

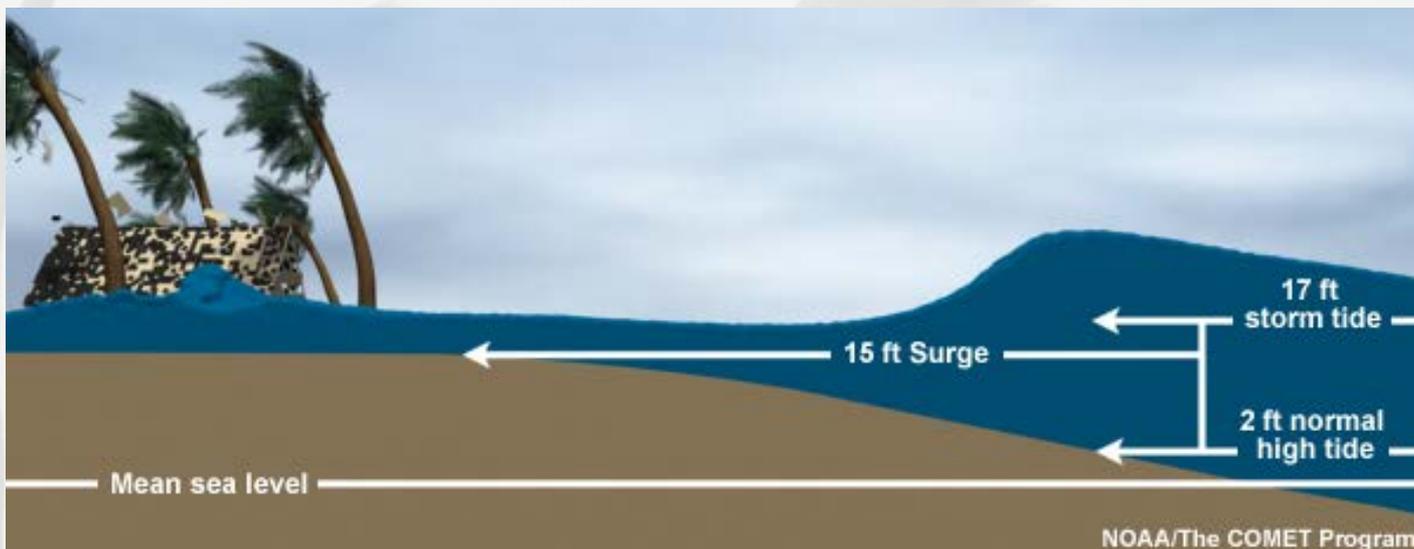

\$108 billion damage

Storm Surge

Storm Surge vs Storm Tide

STORM SURGE – An abnormal rise of water generated by a storm, over and above the predicted astronomical tide.

STORM TIDE – The water level rise due to the combination of storm surge and the astronomical tide.

Storm Surge History

Gulf Coast

Hurricane Katrina (2005)

Hurricane Georges (1998)

Hurricane Carol (1954)

Hurricane Irene (2011)

1938 Hurricane

Hurricane Sandy (2012)

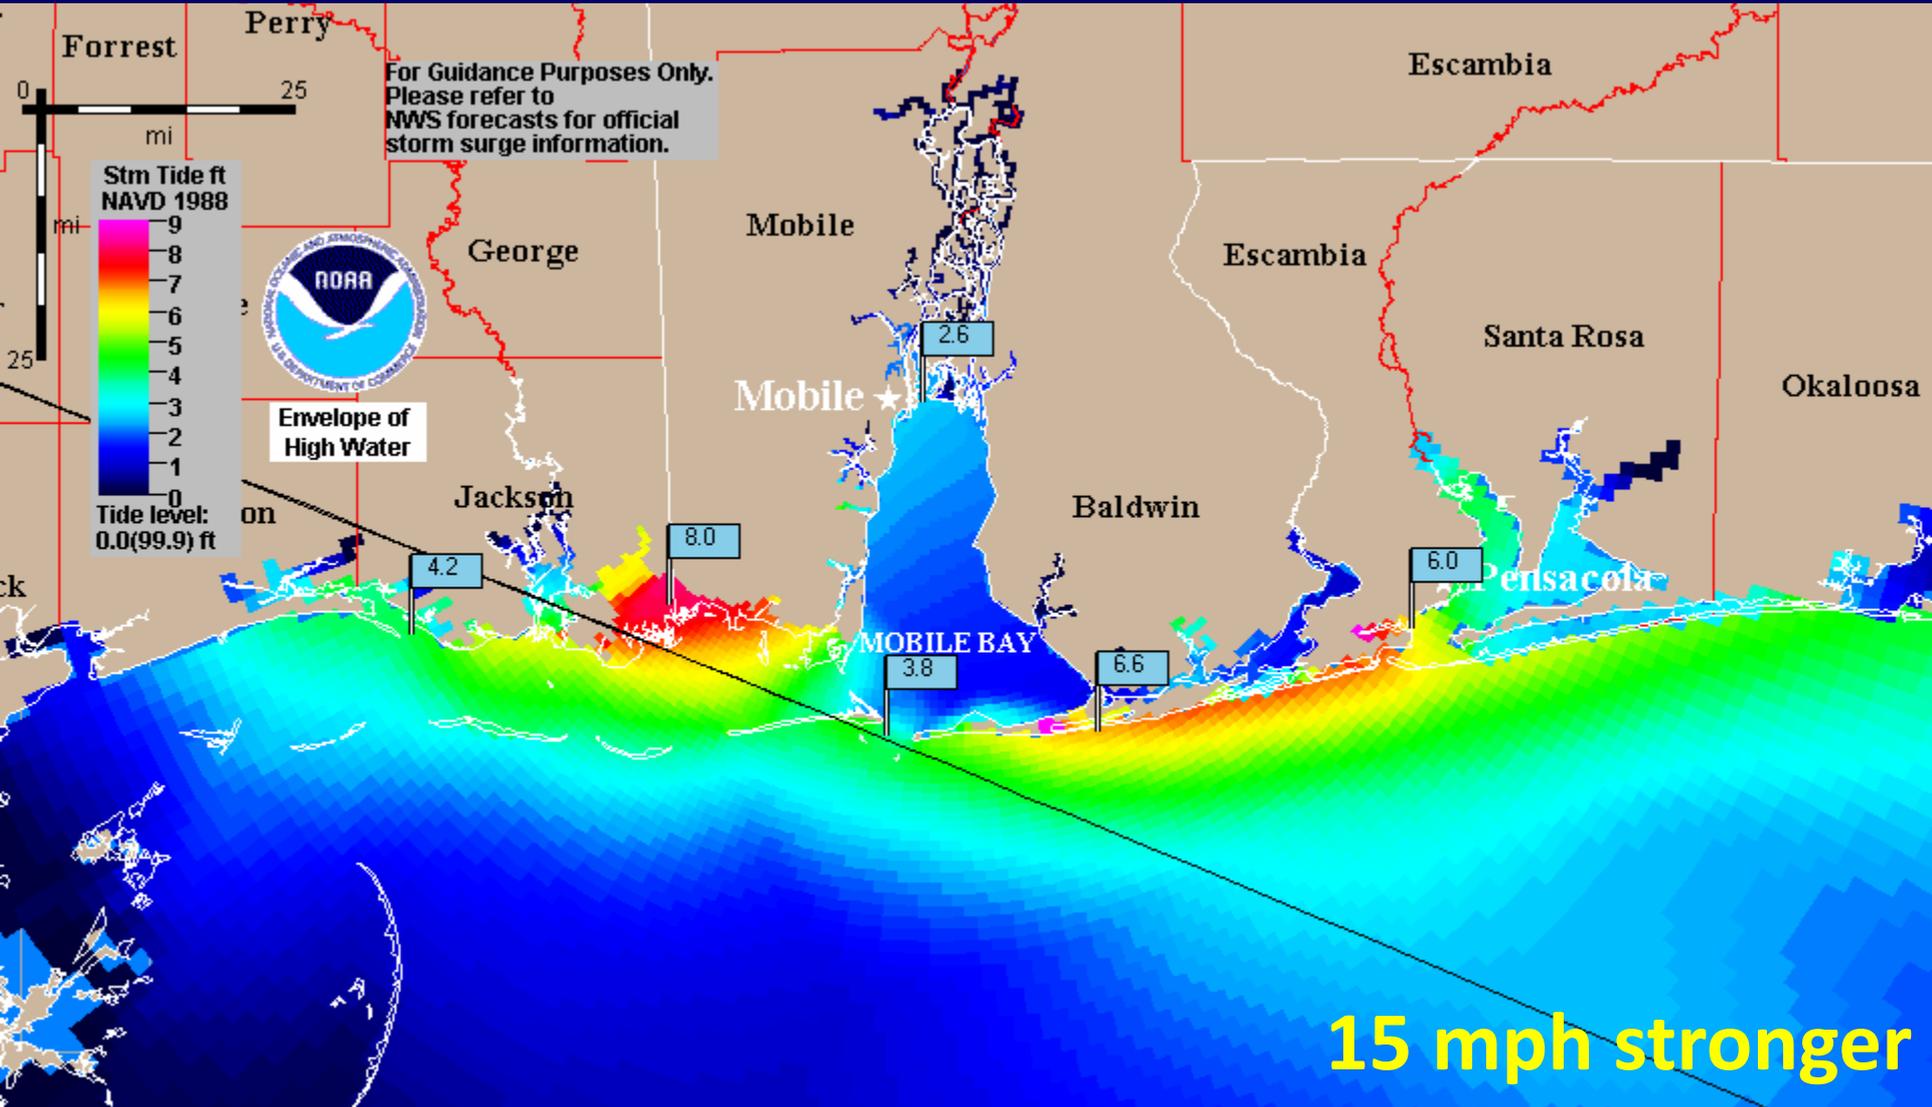

Storm Surge

Factors Affecting Storm Surge

- **Intensity**
Stronger storm = More storm surge
- **Size (RMW)**
Bigger storm = More storm surge
- **Forward Speed**
Slower storm = Storm surge farther inland
- **Width and Slope of Shelf (Bathymetry)**
Gradual shelf = More storm surge
- **Angle of approach**
Alters focus of storm surge
- **Central Pressure**
Pressure driven surge about 5% of total storm surge

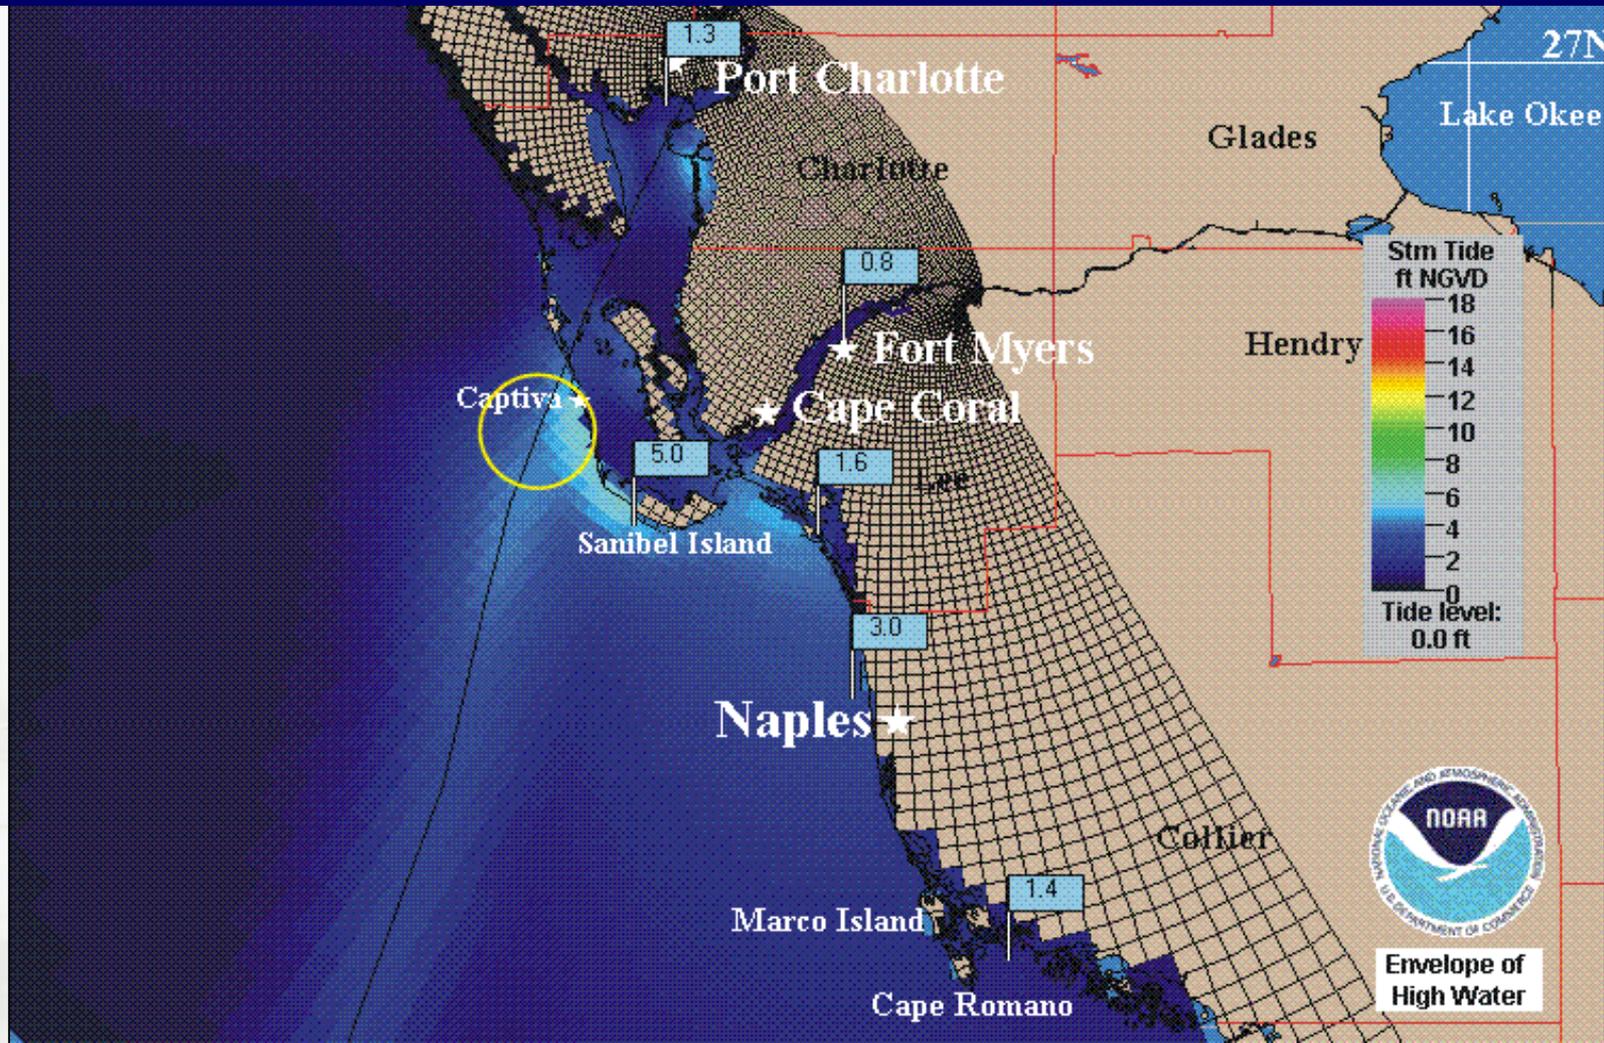

Storm Surge

What's the effect of intensity?

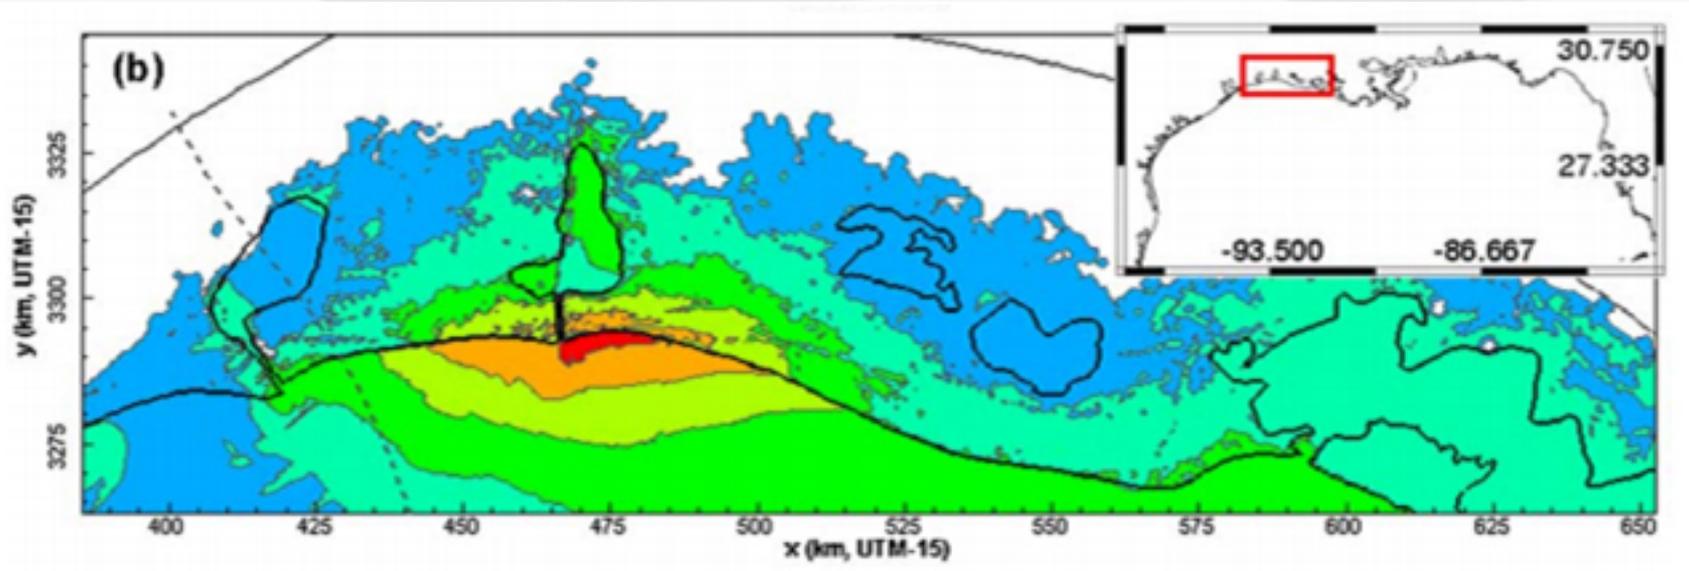

Storm Surge

What's the effect of size?

Storm Surge

What's the effect of forward speed?

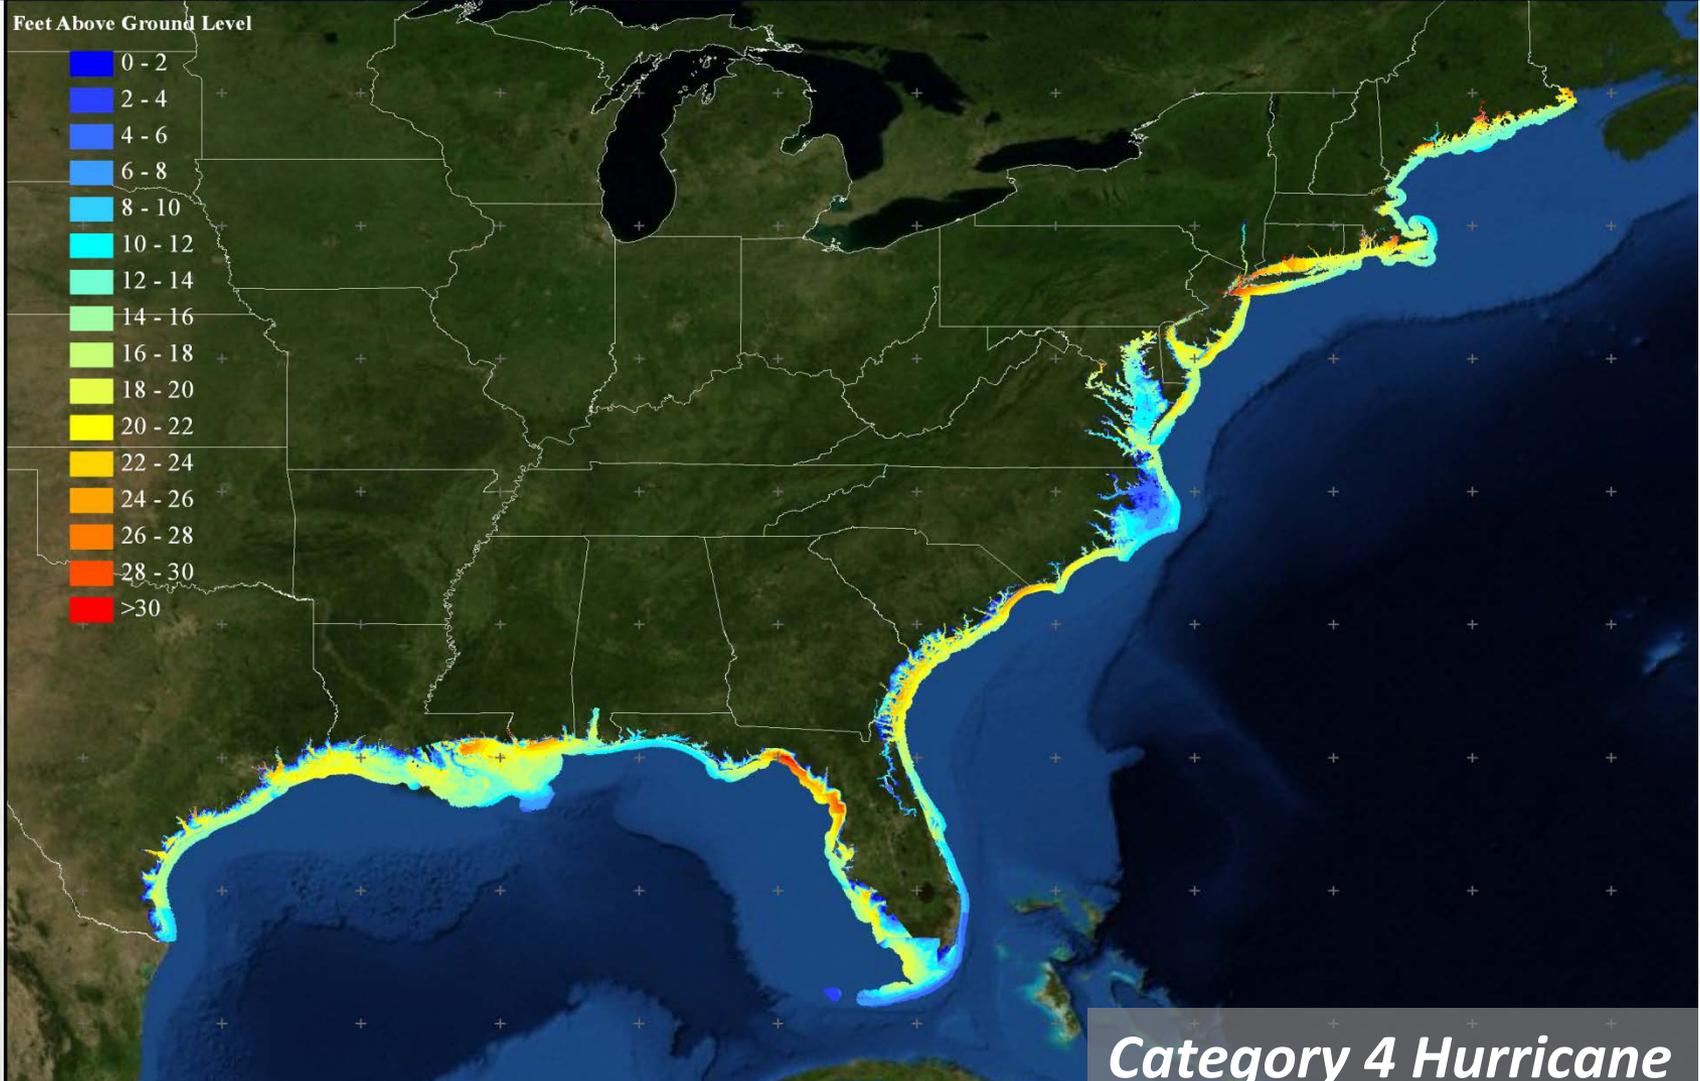

Fast Speed (25 mph)

- Higher maximum

Storm Surge

Location. Location. Location.

Storm Surge

What's the effect of width/slope of shelf?

Wide shelf – Gentle slope

Narrow shelf – Sharp slope

Storm Surge

Wave Setup

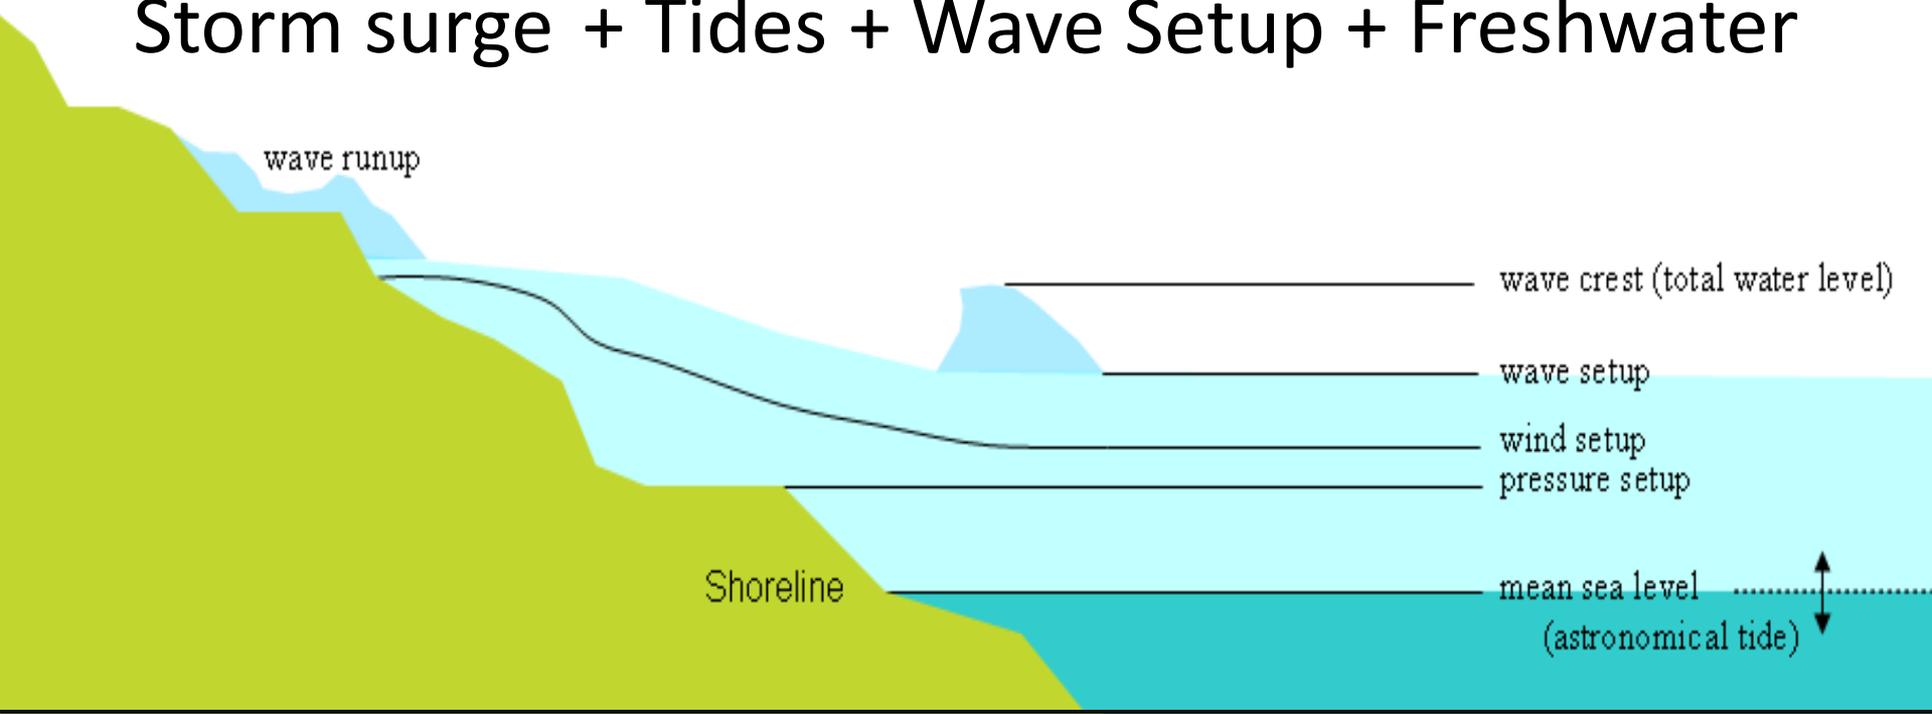

Storm Surge

Components of 'Total Water Level'

Total Water Level

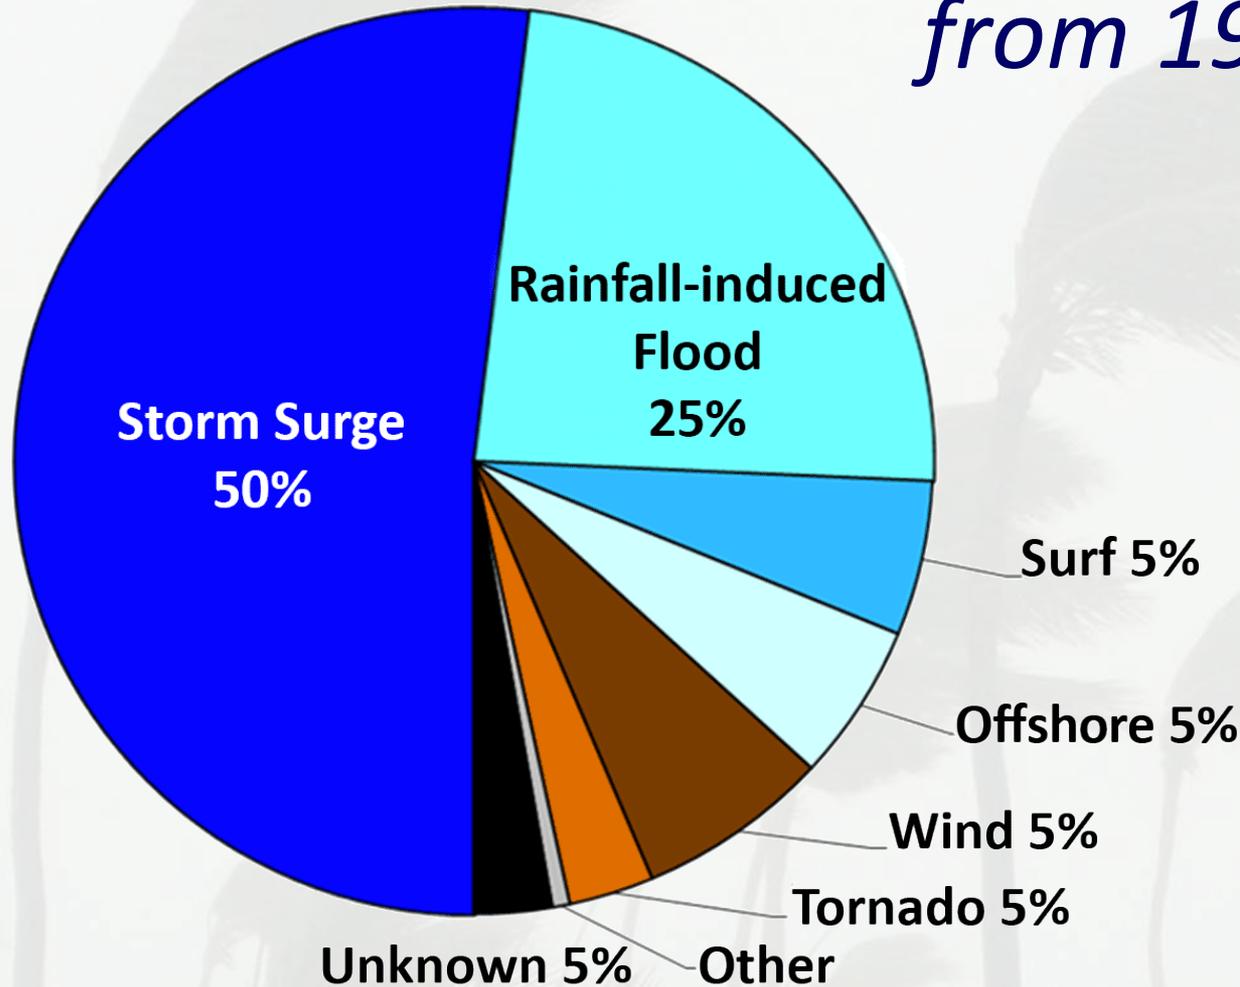

Storm surge + Tides + Wave Setup + Freshwater

Freshwater Flooding

U.S. Atlantic Tropical Cyclone Deaths

from 1963 - 2012

Freshwater Flooding

Flash Floods. Riverine Flooding.

Freshwater Flooding

Floyd (1999) – Tarboro, NC

Reuters

Freshwater Flooding

Interstate 10 – Houston, TX

Interstate 10 – West View

Freshwater Flooding

TS Allison (2001) – Houston, TX

Interstate 10 – West View

Houston Chronicle

Freshwater Flooding

Factors Affecting Tropical Cyclone Rainfall.

1. Forward Speed

(Slower storm = More rain)

2. Size

(Bigger storm = More rain)

3. Rain Rate

(Higher rain rate = More rain)

4. Vertical Wind Shear

(More rain on one side)

5. Topography / Mountains

(More rain on windward side)

6. Fronts / Upper-Level Troughs

Tornadoes

Landfalling hurricanes spawn tornadoes

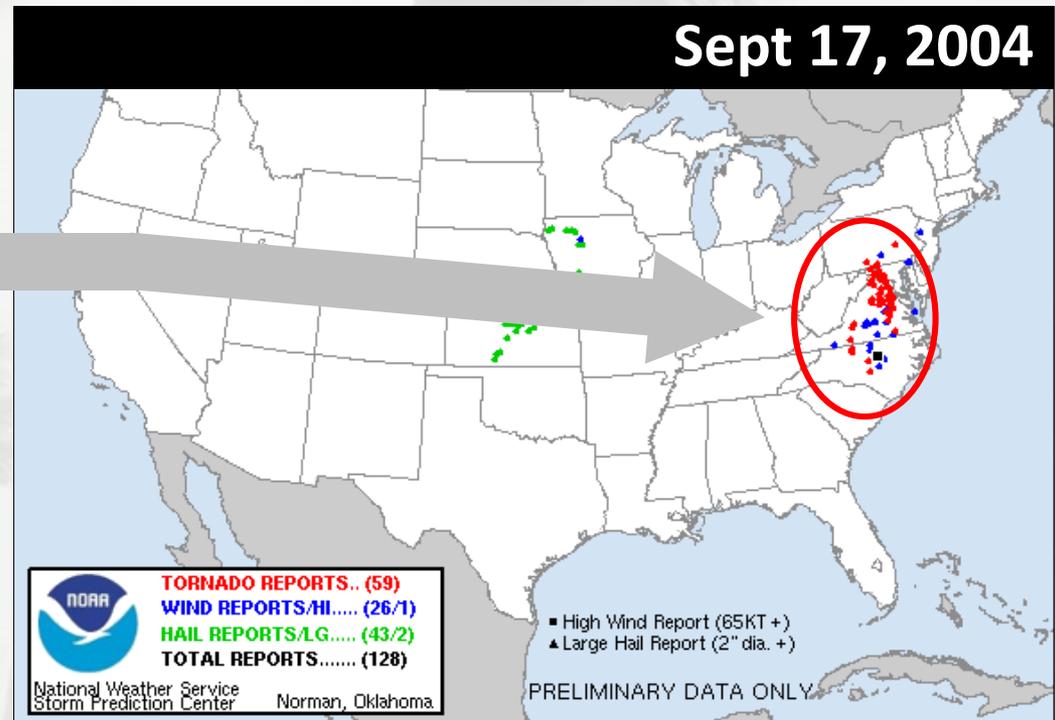

- 70% produce at least 1 tornado
- 40% produce more than 3 tornadoes

Tornado “outbreak”

Hurricane Ivan (2004)

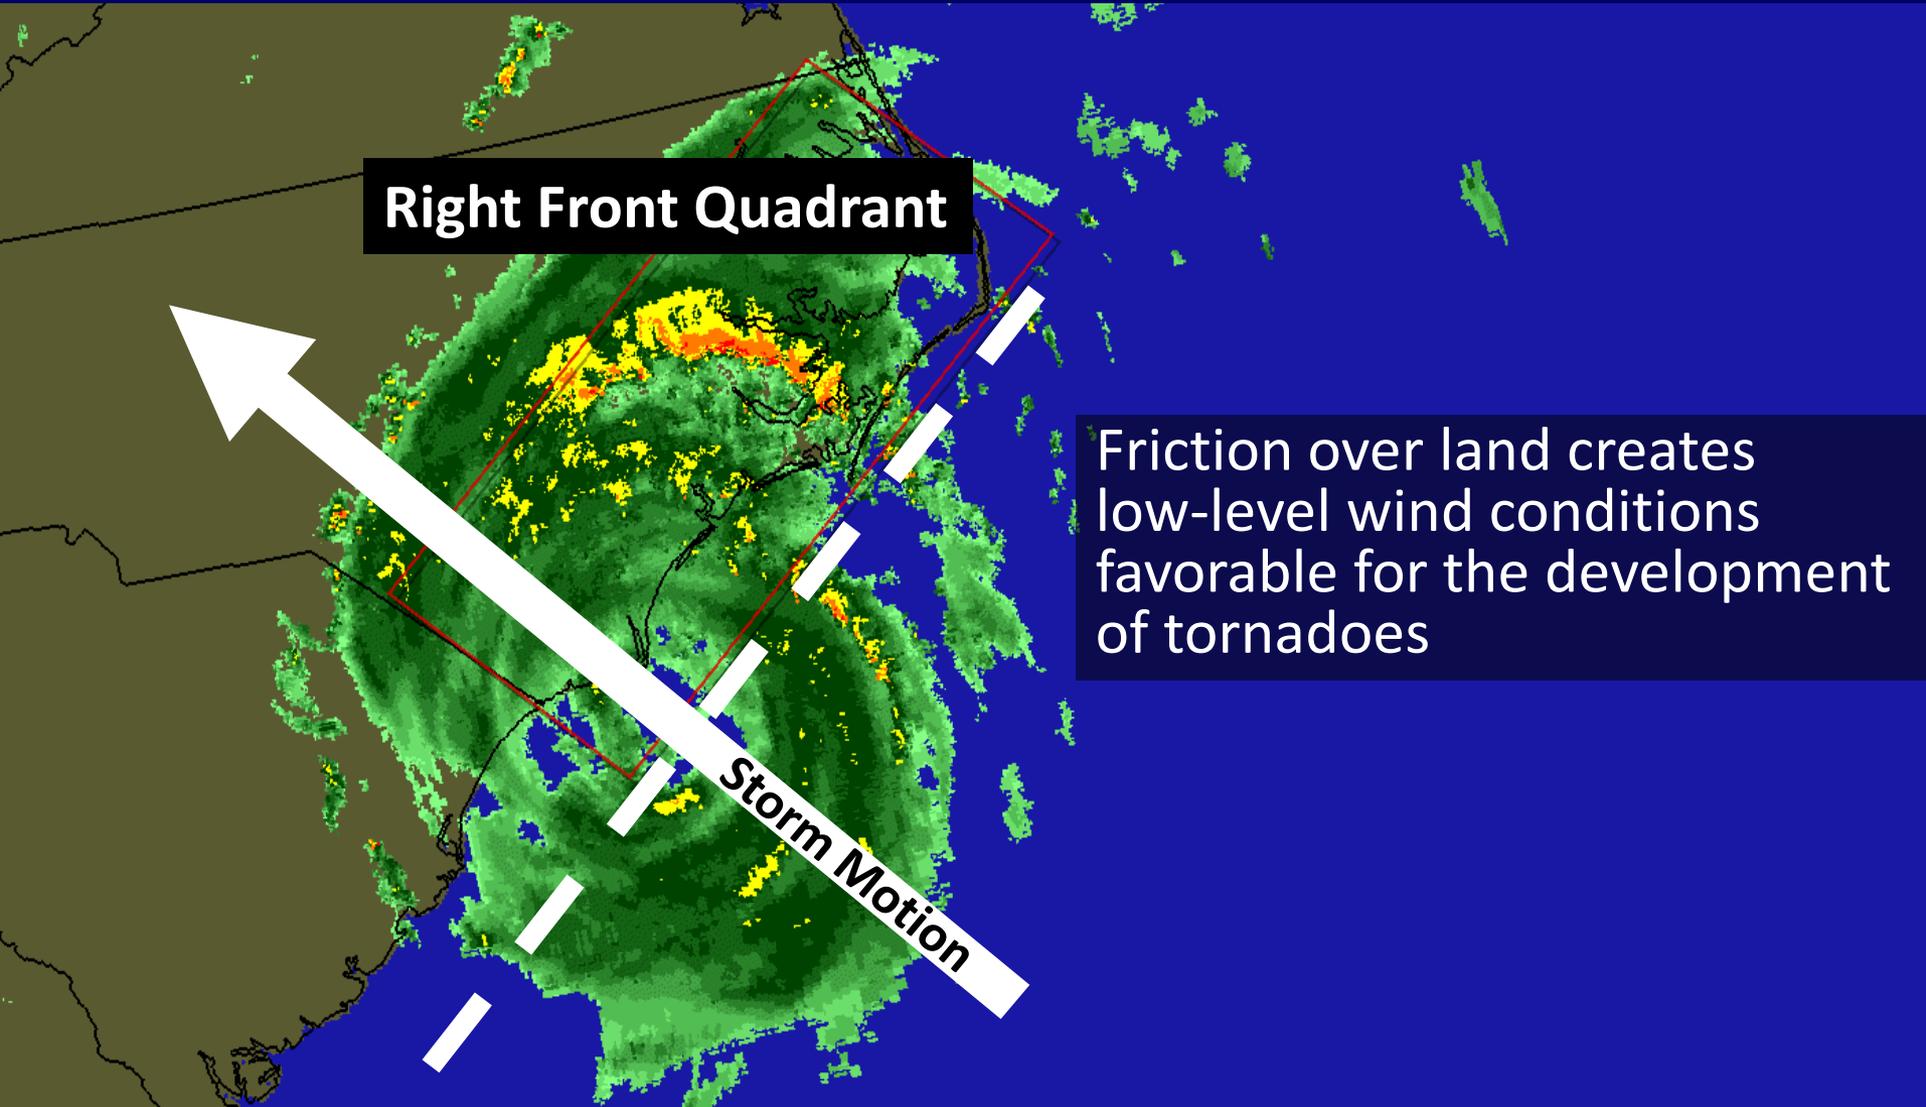

– 117 Tornadoes

1. Hurricane Beulah (1967): 141
2. Hurricane Ivan (2004): 117
3. Hurricane Frances (2004): 101
4. Hurricane Camille (1969): 80
5. Hurricane Katrina (2005): 43

Tornadoes

Landfalling Hurricanes Spawn Tornadoes

Waves and Rip Currents

Can occur when a storm is well offshore

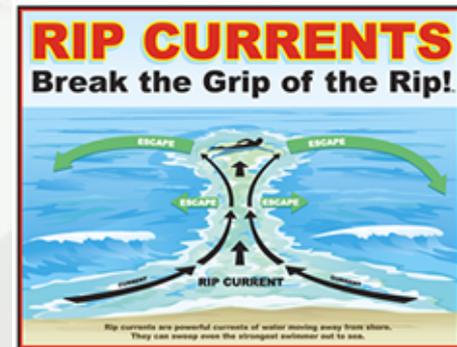

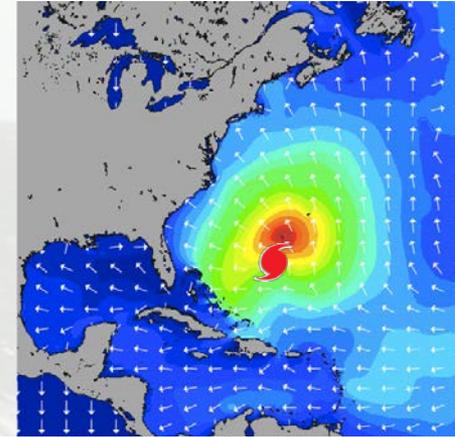

Swells from a large hurricane can affect the beach of the entire western Atlantic

Hurricane Bertha (2008)

- Over 1500 rescues in Ocean City, Maryland
- 3 people drowned along the coast of New Jersey

Hurricane Bill (2009)

- 1 person died in Maine
- 1 person died in Florida

IF CAUGHT IN A RIP CURRENT

- ◆ Don't fight the current
- ◆ Swim out of the current, then to shore
- ◆ If you can't escape, float or tread water
- ◆ If you need help, call or wave for assistance

SAFETY

- ◆ Know how to swim
- ◆ Never swim alone
- ◆ If in doubt, don't go out

More information about rip currents can be found at the following web sites:
www.ripcurrents.noaa.gov
www.us18.org
